ABSTRACT

Provided are a video display device and a method of controlling the same. The method includes: obtaining an uncompressed audio-visual (AV) content; playing the uncompressed AV content through the display unit; obtaining content information of the uncompressed AV content on the basis of a content section of the uncompressed AV content; obtaining content change time information and enhanced service information on the basis of the content information; and determining a delay time for obtaining the next content information on the basis of the content change time information.

CROSS-REFERENCE TO RELATED APPLICATIONS

This application is continuation application of U.S. patent application Ser. No. 14/326,687, filed on Jul. 9, 2014, which is a continuation of U.S. patent application Ser. No. 13/883,600, filed on May 6, 2013, now U.S. Pat. No. 8,848,108, which is a national stage application of PCT/KR2011/009044, filed Nov. 24, 2011, which claims priority to U.S. Provisional Application No. 61/417,196, filed on Nov. 24, 2010, U.S. Provisional Application No. 61/549,238, filed on Oct. 20, 2011, U.S. Provisional Application No. 61/549,237, filed on Oct. 20, 2011, U.S. Provisional Application No. 61/490,067, filed on May 26, 2011, and U.S. Provisional Application No. 61/526,685, filed Aug. 24, 2011, which are hereby incorporated by reference as if fully set forth herein.

BACKGROUND

The present disclosure relates to a video display device and a method of controlling the same.

As digital broadcasting is paving the way for its extensive spread, a broadcasting station transmits both main audio-visual (AV) contents and enhanced service data, which may be linked to the main AV contents to provide information and services or may be separately provided for other purposes.

However, a video display device in each home may unlikely receive broadcast signals directly through air under a current broadcasting environment. Rather, most of cases, a video display device in each home is connected to a broadcast receiving device to display uncompressed audio-visual contents that the broadcast receiving device provides.

Additionally, the broadcast receiving device receives contents from a server (called a Multichannel Video Programming Distributor (MVPD)). The MVPD receives a broadcast signal from a broadcasting station, extracts contents from the received broadcast signal, converts the extracted content into signals having a proper format for transmission, and provides the converted signals to a broadcast receiving device. During these processes, the MVPD may exclude extracted enhanced service data or may add another enhanced service data, so that the broadcasting station may serve to provide AV contents but may not provide enhanced services led by the broadcasting station.

Since the broadcast receiving device extracts main AV data from signal received from the MVPD and provides only uncompressed audio-visual data to a video display device, only enhanced services provided from the broadcast receiving device not the video display device are available. Furthermore, the broadcasting station may not provide enhanced services led by itself.

Additionally, even when the broadcasting station provides enhanced services through wireless channels, the enhanced services may not be provided enough due to bandwidth limitation.

SUMMARY

Embodiments provide a video display device for available enhanced services led by a broadcasting station, and a method of controlling the same.

In one embodiment, a method of controlling a video display device includes: obtaining an uncompressed audio-visual (AV) content; playing the uncompressed AV content

through the display unit; obtaining content information of the uncompressed AV content on the basis of a content section of the uncompressed AV content; obtaining content change time information and enhanced service information on the basis of the content information; and determining a delay time for obtaining the next content information on the basis of the content change time information.

In another embodiment, a method of controlling a video display device including a display unit includes: obtaining an uncompressed AV content; playing the uncompressed AV content through the display unit; extracting a content section of the uncompressed AV content; obtaining content information including an identifier of the uncompressed AV content and a start time of the extracted content section on the basis of the extracted content section; obtaining enhanced service information including a first delay time on the basis of the extracted content section or the content information; determining a second delay time on the basis of the first delay time; and starting an enhanced service corresponding to the enhanced service information when the second delay time elapses.

In further another embodiment, a video display device includes: a display unit; a receiving unit obtaining an uncompressed AV content; an enhanced service management unit obtaining content information of the uncompressed AV content on the basis of a content section of the uncompressed AV content, obtaining content change time information and enhanced service information on the basis of the content information, and determining a delay time for obtaining the next content information on the basis of the content change time information; and a play controlling unit playing the uncompressed AV content through the display unit.

In still further another embodiment, a video display device includes: a display unit; a receiving unit obtaining an uncompressed AV content; an enhanced service management unit obtaining content information including an identifier of the uncompressed AV content and a start time of the extracted content section on the basis of a content section extracted from the uncompressed AV content, obtaining enhanced service information including a first delay time on the basis of the extracted content section or the content information, determining a second delay time on the basis of the first delay time, and starting an enhanced service corresponding to the enhanced service information when the second delay time elapses; and a play controlling unit playing the uncompressed AV content through the display unit.

In still further another embodiment, a video display device includes: a display unit; a receiving unit obtaining an uncompressed AV content; a content recognizing unit obtaining content information of the uncompressed AV content on the basis of a content section of the uncompressed AV content; a life cycle management unit managing an enhanced service according to enhanced service information obtained on the basis of the content information; and a play controlling unit playing the uncompressed AV content and the enhanced service on the display unit.

The details of one or more embodiments are set forth in the accompanying drawings and the description below. Other features will be apparent from the description and drawings, and from the claims.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 69 is a block diagram illustrating a structure of a watermark based video display device according to another embodiment.

DETAILED DESCRIPTION OF THE EMBODIMENTS

Hereinafter, a mobile terminal relating to the present invention will be described in more detail with reference to the accompanying drawings. Noun suffixes such as “engine”, “module”, and “unit” for components in description below are given or mixed in consideration of easiness in writing the specification. That is, the noun suffixes themselves does not have respectively distinguishable meanings or roles.

A network topology will be described with reference to FIGS. 1 to 9 according to an embodiment.

FIG. 1 is a block diagram illustrating the network topology according to the embodiment.

As shown in FIG. 1, the network topology includes a content providing server 10, a content recognizing service providing server 20, a multi channel video distributing server 30, an enhanced service information providing server 40, a plurality of enhanced service providing servers 50, a broadcast receiving device 60, a network 70, and a video display device 100.

The content providing server 10 may correspond to a broadcasting station and broadcasts a broadcast signal including main audio-visual contents. The broadcast signal may

6

further include enhanced services. The enhanced services may or may not relate to main audio-visual contents. The enhanced services may have formats such as service information, metadata, additional data, compiled execution files, web applications, Hypertext Markup Language (HTML) documents, XML documents, Cascading Style Sheet (CSS) documents, audio files, video files, ATSC 2.0 contents, and addresses such as Uniform Resource Locator (URL). There may be at least one content providing server.

The content recognizing service providing server 20 provides a content recognizing service that allows the video display device 100 to recognize content on the basis of main audio-visual content. The content recognizing service providing server 20 may or may not edit the main audio-visual content. There may be at least one content recognizing service providing server.

The content recognizing service providing server 20 may be a watermark server that edits the main audio-visual content to insert a visible watermark, which may look a logo, into the main audio-visual content. This watermark server may insert the logo of a content provider at the upper-left or upper-right of each frame in the main audio-visual content as a watermark.

Additionally, the content recognizing service providing server 20 may be a watermark server that edits the main audio-visual content to insert content information into the main audio-visual content as an invisible watermark.

Additionally, the content recognizing service providing server 20 may be a fingerprint server that extracts feature information from some frames or audio samples of the main audio-visual content and stores it. This feature information is called signature.

The multi channel video distributing server 30 receives and multiplexes broadcast signals from a plurality of broadcasting stations and provides the multiplexed broadcast signals to the broadcast receiving device 60. Especially, the multi channel video distributing server 30 performs demodulation and channel decoding on the received broadcast signals to extract main audio-visual content and enhanced service, and then, performs channel encoding on the extracted main audio-visual content and enhanced service to generate a multiplexed signal for distribution. At this point, since the multi channel video distributing server 30 may exclude the extracted enhanced service or may add another enhanced service, a broadcasting station may not provide services led by it. There may be at least one multi channel video distributing server.

The broadcasting device 60 may tune a channel selected by a user and receives a signal of the tuned channel, and then, performs demodulation and channel decoding on the received signal to extract a main audio-visual content. The broadcasting device 60 decodes the extracted main audio-visual content through H.264/Moving Picture Experts Group-4 advanced video coding (MPEG-4 AVC), Dolby AC-3 or Moving Picture Experts Group-2 Advanced Audio Coding (MPEG-2 AAC) algorithm to generate an uncompressed main audio-visual (AV) content. The broadcast receiving device 60 provides the generated uncompressed main AV content to the video display device 100 through its external input port.

The enhanced service information providing server 40 provides enhanced service information on at least one available enhanced service relating to a main AV content in response to a request of a video display device. There may be at least one enhanced service providing server. The enhanced service information providing server 40 may provide enhanced service information on the enhanced service having the highest priority among a plurality of available enhanced services.

The enhanced service providing server **50** provides at least one available enhanced service relating to a main AV content in response to a request of a video display device. There may be at least one enhanced service providing server.

The video display device **100** may be a television, a notebook computer, a hand phone, and a smart phone, each including a display unit. The video display device **100** may receive an uncompressed main AV content from the broadcast receiving device **60** or a broadcast signal including an encoded main AV content from the contents providing server **10** or the multi channel video distributing server **30**. The video display device **100** may receive a content recognizing service from the content recognizing service providing server **20** through the network **70**, an address of at least one available enhanced service relating to a main AV content from the enhanced service information providing server **40** through the network **70**, and at least one available enhanced service relating to a main AV content from the enhanced service providing server **50**.

At least two of the content providing server **10**, the content recognizing service providing server **20**, the multi channel video distributing server **30**, the enhanced service information providing server **40**, and the plurality of enhanced service providing servers **50** may be combined in a form of one server and may be operated by one provider.

FIG. 2 is a block diagram illustrating a watermark based network topology according to an embodiment.

As shown in FIG. 2, the watermark based network topology may further include a watermark server **21**.

As shown in FIG. 2, the watermark server **21** edits a main AV content to insert content information into it. The multi channel video distributing server **30** may receive and distribute a broadcast signal including the modified main AV content. Especially, a watermark server may use a digital watermarking technique described below.

A digital watermark is a process for inserting information, which may be almost undeletable, into a digital signal. For example, the digital signal may be audio, picture, or video. If the digital signal is copied, the inserted information is included in the copy. One digital signal may carry several different watermarks simultaneously.

In visible watermarking, the inserted information may be identifiable in a picture or video. Typically, the inserted information may be a text or logo identifying a media owner. If a television broadcasting station adds its logo in a corner of a video, this is an identifiable watermark.

In invisible watermarking, although information as digital data is added to audio, picture, or video, a user may be aware of a predetermined amount of information but may not recognize it. A secret message may be delivered through the invisible watermarking.

One application of the watermarking is a copyright protection system for preventing the illegal copy of digital media. For example, a copy device obtains a watermark from digital media before copying the digital media and determines whether to copy or not on the bases of the content of the watermark.

Another application of the watermarking is source tracking of digital media. A watermark is embedded in the digital media at each point of a distribution path. If such digital media is found later, a watermark may be extracted from the digital media and a distribution source may be recognized from the content of the watermark.

Another application of invisible watermarking is a description for digital media.

A file format for digital media may include additional information called metadata and a digital watermark is distinguished from metadata in that it is delivered as an AV signal itself of digital media.

The watermarking method may include spread spectrum, quantization, and amplitude modulation.

If a marked signal is obtained through additional editing, the watermarking method corresponds to the spread spectrum. Although it is known that the spread spectrum watermark is quite strong, not much information is contained because the watermark interferes with an embedded host signal.

If a marked signal is obtained through the quantization, the watermarking method corresponds to a quantization type. The quantization watermark is weak, much information may be contained.

If a marked signal is obtained through an additional editing method similar to the spread spectrum in a spatial domain, a watermarking method corresponds to the amplitude modulation.

FIG. 3 is a ladder diagram illustrating a data flow in a watermark based network topology according to an embodiment.

First, the content providing server **10** transmits a broadcast signal including a main AV content and an enhanced service in operation **S101**.

The watermark server **21** receives a broadcast signal that the content providing server **10** provides, inserts a visible watermark such as a logo or watermark information as an invisible watermark into the main AV content by editing the main AV content, and provides the watermarked main AV content and enhanced service to the MVPD **30** in operation **S103**.

The watermark information inserted through an invisible watermark may include at least one of a watermark purpose, content information, enhanced service information, and an available enhanced service. The watermark purpose represents one of illegal copy prevention, viewer ratings, and enhanced service acquisition.

The content information may include at least one of identification information of a content provider that provides main AV content, main AV content identification information, time information of a content section used in content information acquisition, names of channels through which main AV content is broadcasted, logos of channels through which main AV content is broadcasted, descriptions of channels through which main AV content is broadcasted, a usage information reporting period, the minimum usage time for usage information acquisition, and available enhanced service information relating to main AV content.

If the video display device **100** uses a watermark to acquire content information, the time information of a content section used for content information acquisition may be the time information of a content section into which a watermark used is embedded. If the video display device **100** uses a fingerprint to acquire content information, the time information of a content section used for content information acquisition may be the time information of a content section where feature information is extracted. The time information of a content section used for content information acquisition may include at least one of the start time of a content section used for content information acquisition, the duration of a content section used for content information acquisition, and the end time of a content section used for content information acquisition.

The usage information reporting address may include at least one of a main AV content watching information report-

ing address and an enhanced service usage information reporting address. The usage information reporting period may include at least one of a main AV content watching information reporting period and an enhanced service usage information reporting period. A minimum usage time for usage information acquisition may include at least one of a minimum watching time for a main AV content watching information acquisition and a minimum usage time for enhanced service usage information extraction.

On the basis that a main AV content is watched for more than the minimum watching time, the video display device **100** acquires watching information of the main AV content and reports the acquired watching information to the main AV content watching information reporting address in the main AV content watching information reporting period.

On the basis that an enhanced service is used for more than the minimum usage time, the video display device **100** acquires enhanced service usage information and reports the acquired usage information to the enhanced service usage information reporting address in the enhanced service usage information reporting period.

The enhanced service information may include at least one of information on whether an enhanced service exists, an enhanced service address providing server address, an acquisition path of each available enhanced service, an address for each available enhanced service, a start time of each available enhanced service, an end time of each available enhanced service, a lifetime of each available enhanced service, an acquisition mode of each available enhanced service, a request period of each available enhanced service, priority information each available enhanced service, description of each available enhanced service, a category of each available enhanced service, a usage information reporting address, a usage information reporting period, and the minimum usage time for usage information acquisition.

The acquisition path of available enhanced service may be represented with IP or Advanced Television Systems Committee—Mobile/Handheld (ATSC M/H). If the acquisition path of available enhanced service is ATSC M/H, enhanced service information may further include frequency information and channel information. An acquisition mode of each available enhanced service may represent Push or Pull.

Moreover, the watermark server **21** may insert watermark information as an invisible watermark into the logo of a main AV content.

For example, the watermark server **21** may insert a barcode at a predetermined position of a logo. At this point, the predetermined position of the logo may correspond to the first line at the bottom of an area where the logo is displayed. The video display device **100** may not display a barcode when receiving a main AV content including a logo with the barcode inserted.

For example, the watermark server **21** may insert a barcode at a predetermined position of a logo. At this point, the log may maintain its form.

For example, the watermark server **21** may insert N-bit watermark information at each of the logos of M frames. That is, the watermark server **21** may insert M*N watermark information in M frames.

The MVPD **30** receives broadcast signals including watermarked main AV content and enhanced service and generates a multiplexed signal to provide it to the broadcast receiving device **60** in operation S105. At this point, the multiplexed signal may exclude the received enhanced service or may include new enhanced service.

The broadcast receiving device **60** tunes a channel that a user selects and receives signals of the tuned channel,

demodulates the received signals, performs channel decoding and AV decoding on the demodulated signals to generate an uncompressed main AV content, and then, provides the generated uncompressed main AV content to the video display device **100** in operation S106.

Moreover, the content providing server **10** also broadcasts a broadcast signal including a main AV content through a wireless channel in operation S107.

Additionally, the MVPD **30** may directly transmit a broadcast signal including a main AV content to the video display device **100** without going through the broadcast receiving device **60** in operation S108.

The video display device **100** may receive an uncompressed main AV content through the broadcast receiving device **60**. Additionally, the video display device **100** may receive a broadcast signal through a wireless channel, and then, may demodulate and decode the received broadcast signal to obtain a main AV content. Additionally, the video display device **100** may receive a broadcast signal from the MVPD **30**, and then, may demodulate and decode the received broadcast signal to obtain a main AV content. The video display device **100** extracts watermark information from some frames or a section of audio samples of the obtained main AV content. If watermark information corresponds to a logo, the video display device **100** confirms a watermark server address corresponding to a logo extracted from a corresponding relationship between a plurality of logos and a plurality of watermark server addresses. When the watermark information corresponds to the logo, the video display device **100** cannot identify the main AV content only with the logo. Additionally, when the watermark information does not include content information, the video display device **100** cannot identify the main AV content but the watermark information may include content provider identifying information or a watermark server address. When the watermark information includes the content provider identifying information, the video display device **100** may confirm a watermark server address corresponding to the content provider identifying information extracted from a corresponding relationship between a plurality of content provider identifying information and a plurality of watermark server addresses. In this manner, when the video display device **100** cannot identify a main AV content the video display device **100** only with the watermark information, it accesses the watermark server **21** corresponding to the obtained watermark server address to transmit a first query in operation S109.

The watermark server **21** provides a first reply to the first query in operation S111. The first reply may include at least one of content information, enhanced service information, and an available enhanced service.

If the watermark information and the first reply do not include an enhanced service address, the video display device **100** cannot obtain enhanced service. However, the watermark information and the first reply may include an enhanced service address providing server address. In this manner, the video display device **100** does not obtain a service address or enhanced service through the watermark information and the first reply. If the video display device **100** obtains an enhanced service address providing server address, it accesses the enhanced service information providing server **40** corresponding to the obtained enhanced service address providing server address to transmit a second query including content information in operation S119.

The enhanced service information providing server **40** searches at least one available enhanced service relating to the content information of the second query. Later, the enhanced

11

service information providing server **40** provides to the video display device **100** enhanced service information for at least one available enhanced service as a second reply to the second query in operation **S121**.

If the video display device **100** obtains at least one available enhanced service address through the watermark information, the first reply, or the second reply, it accesses the at least one available enhanced service address to request enhanced service in operation **S123**, and then, obtains the enhanced service in operation **S125**.

FIG. **4** is a view illustrating a watermark based content recognition timing according to an embodiment.

As shown in FIG. **4**, when the broadcast receiving device **60** is turned on and tunes a channel, and also, the video display device **100** receives a main AV content of the turned channel from the broadcast receiving device **60** through an external input port **111**, the video display device **100** may sense a content provider identifier (or a broadcasting station identifier) from the watermark of the main AV content. Then, the video display device **100** may sense content information from the watermark of the main AV content on the basis of the sensed content provider identifier.

At this point, as shown in FIG. **4**, the detection available period of the content provider identifier may be different from that of the content information. Especially, the detection available period of the content provider identifier may be shorter than that of the content information. Through this, the video display device **100** may have an efficient configuration for detecting only necessary information.

FIG. **5** is a block diagram illustrating a fingerprint based network topology according to an embodiment.

As shown in FIG. **5**, the network topology may further include a fingerprint server **22**.

As shown in FIG. **5**, the fingerprint server **22** does not edit a main AV content, but extracts feature information from some frames or a section of audio samples of the main AV content and stores the extracted feature information. Then, when receiving the feature information from the video display device **100**, the fingerprint server **22** provides an identifier and time information of an AV content corresponding to the received feature information.

FIG. **6** is a ladder diagram illustrating a data flow in a fingerprint based network topology according to an embodiment.

First, the content providing server **10** transmits a broadcast signal including a main AV content and an enhanced service in operation **S201**.

The fingerprint server **22** receives a broadcast signal that the content providing server **10**, extracts a plurality of pieces of feature information from a plurality of frame sections or a plurality of audio sections of the main AV content, and establishes a database for a plurality of query results corresponding to the plurality of feature information in operation **S203**. The query result may include at least one of content information, enhanced service information, and an available enhanced service.

The MVPD **30** receives broadcast signals including a main AV content and enhanced service and generates a multiplexed signal to provide it to the broadcast receiving device **60** in operation **S205**. At this point, the multiplexed signal may exclude the received enhanced service or may include new enhanced service.

The broadcast receiving device **60** tunes a channel that a user selects and receives signals of the tuned channel, demodulates the received signals, performs channel decoding and AV decoding on the demodulated signals to generate an

12

uncompressed main AV content, and then, provides the generated uncompressed main AV content to the video display device **100** in operation **S206**.

Moreover, the content providing server **10** also broadcasts a broadcast signal including a main AV content through a wireless channel in operation **S207**.

Additionally, the MVPD **30** may directly transmit a broadcast signal including a main AV content to the video display device **100** without going through the broadcast receiving device **60**.

The video display device **100** may receive an uncompressed main AV content through the broadcast receiving device **60**. Additionally, the video display device **100** may receive a broadcast signal through a wireless channel, and then, may demodulate and decode the received broadcast signal to obtain a main AV content. Additionally, the video display device **100** may receive a broadcast signal from the MVPD **30**, and then, may demodulate and decode the received broadcast signal to obtain a main AV content. The video display device **100** extracts feature information from some frames or a section of audio samples of the obtained main AV content in operation **S213**.

The video display device **100** accesses the fingerprint server **22** corresponding to the predetermined fingerprint server address to transmit a first query including the extracted feature information in operation **S215**.

The fingerprint server **22** provides a query result as a first reply to the first query in operation **S217**. If the first reply corresponds to fail, the video display device **100** accesses the fingerprint server **22** corresponding to another fingerprint server address to transmit a first query including the extracted feature information.

The fingerprint server **22** may provide Extensible Markup Language (XML) document as a query result. Examples of the XML document containing a query result will be described with reference to FIG. **7** and Table 1.

FIG. **7** is a view illustrating an XML schema diagram of ACR-ResultType containing a query result according to an embodiment.

As shown in FIG. **7**, ACR-ResultType containing a query result includes ResultCode attributes and ContentID, NTP-Timestamp, SignalingChannelInformation, and ServiceInformation elements.

For example, if the ResultCode attribute has 200, this may mean that the query result is successful. For example, if the ResultCode attribute has 404, this may mean that the query result is unsuccessful.

The SignalingChannelInformation element includes a SignalingChannelURL, and the SignalingChannelURL element includes an UpdateMode and PollingCycle attributes. The UpdateMode attribute may have a Pull value or a Push value.

The ServiceInformation element includes ServiceName, ServiceLogo, and ServiceDescription elements.

Table 1 illustrates an XML schema of ACR-ResultType containing the query result.

TABLE 1

</xs:complexType>

```

As the ContentID element, an ATSC content identifier may be used as shown in Table 2.

TABLE 2

Syntax	The Number of bits	format
ATSC_content_identifier() {		
TSID	16	uimsbf
reserved	2	bslbf
end_of_day	5	uimsbf
unique_for	9	uimsbf
content_id	var	
}		

As shown in Table 2, the ATSC content identifier has a structure including TSID and a house number.

The 16 bit unsigned integer TSID carries a transport stream identifier.

The 5 bit unsigned integer end_of_day is set with an hour in a day of when a content_id value can be reused after broadcasting is finished.

The 9 bit unsigned integer unique_for is set with the number of day of when the content_id value cannot be reused.

Content_id represents a content identifier. The video display device 100 reduces unique_for by 1 in a corresponding time to end_of_day daily and presumes that content_id is unique if unique_for is not 0.

Moreover, as the ContentID element, a global service identifier for ATSC-M/H service may be used as described below.

The global service identifier has the following form.
 urn:oma:bcast:iauth:atsc:service:<region>:<serviceid>

Here, <region> is an international country code including two characters regulated by ISO 639-2. <xsid> for local service is a decimal number of TSID as defined in <region>, and

<xsid> (regional service) (major>69) is "0". <serviceid> is defined with <major> or <minor>. <major> represent a Major Channel number, and <minor> represents a Minor Channel Number.

5 Examples of the global service identifier are as follows.

-urn:oma:bcast:iauth:atsc:service:us:1234:5.1

-urn:oma:bcast:iauth:atsc:service:us:0:100.200

Moreover, as the ContentID element, an ATSC content identifier may be used as described below.

10 The ATSC content identifier has the following form.

urn:oma:bcast:iauth:atsc:content:<region>:<xsid>:

<contentid>:<unique_for>:<end_of_day>

Here, <region> is an international country code including two characters regulated by ISO 639-2. <xsid> for local service is a decimal number of TSID as defined in <region>, and may be followed by "."<serviceid>. <xsid> for (regional service) (major>69) is <serviceid>. <content_id> is a base64 sign of a content_id field defined in Table 2, <unique_for> is a decimal number sign of an unique_for field defined in Table 2, and <end_of_day> is a decimal number sign of an end_of_day field defined in Table 2.

Hereinafter, FIG. 6 is described again.

If the query result does not include an enhanced service address or enhanced service but includes an enhanced service address providing server address, the video display device 100 accesses the enhanced service information providing server 40 corresponding to the obtained enhanced service address providing server address to transmit a second query including content information in operation S219.

The enhanced service information providing server 40 searches at least one available enhanced service relating to the content information of the second query. Later, the enhanced service information providing server 40 provides to the video display device 100 enhanced service information for at least one available enhanced service as a second reply to the second query in operation S221.

If the video display device 100 obtains at least one available enhanced service address through the first reply or the second reply, it accesses the at least one available enhanced service address to request enhanced service in operation S223, and then, obtains the enhanced service in operation S225.

When the UpdateMode attribute has a Pull value, the video display device 100 transmits an HTTP request to the enhanced service providing server 50 through SignalingChannelURL and receives an HTTP reply including a PSIP binary stream from the enhanced service providing server 50 in response to the request. In this case, the video display device 100 may transmit the HTTP request according to a Polling period designated as the PollingCycle attribute. Additionally, the SignalingChannelURL element may have an update time attribute. In this case, the video display device 100 may transmit the HTTP request according to an update time designated as the update time attribute.

If the UpdateMode attribute has a Push value, the video display device 100 may receive update from a server asynchronously through XMLHTTPRequest API. After the video display device 100 transmits an asynchronous request to a server through XMLHTTPRequest object, if there is a change of signaling information, the server provides the signaling information as a reply through the channel. If there is limitation in session standby time, a server generates a session timeout reply and a receiver recognizes the generated timeout reply to transmit a request again, so that a signaling channel between the receiver and the server may be maintained for all time.

15

FIG. 8 is a block diagram illustrating a watermark and fingerprint based network topology according to an embodiment.

As shown in FIG. 8, the watermark and fingerprint based network topology may further include a watermark server **21** and a fingerprint server **22**.

As shown in FIG. 8, the watermark server **21** inserts content provider identifying information into a main AV content. The watermark server **21** may insert content provider identifying information as a visible watermark such as a logo or an invisible watermark into a main AV content.

The fingerprint server **22** does not edit a main AV content, but extracts feature information from some frames or a certain section of audio samples of the main AV content and stores the extracted feature information. Then, when receiving the feature information from the video display device **100**, the fingerprint server **22** provides an identifier and time information of an AV content corresponding to the received feature information.

FIG. 9 is a ladder diagram illustrating a data flow in a watermark and fingerprint based network topology according to an embodiment.

First, the content providing server **10** transmits a broadcast signal including a main AV content and an enhanced service in operation S301.

The watermark server **21** receives a broadcast signal that the content providing server **10** provides, inserts a visible watermark such as a logo or watermark information as an invisible watermark into the main AV content by editing the main AV content, and provides the watermarked main AV content and enhanced service to the MVPD **30** in operation S303. The watermark information inserted through an invisible watermark may include at least one of content information, enhanced service information, and an available enhanced service. The content information and enhanced service information are described above.

The MVPD **30** receives broadcast signals including watermarked main AV content and enhanced service and generates a multiplexed signal to provide it to the broadcast receiving device **60** in operation S305. At this point, the multiplexed signal may exclude the received enhanced service or may include new enhanced service.

The broadcast receiving device **60** tunes a channel that a user selects and receives signals of the tuned channel, demodulates the received signals, performs channel decoding and AV decoding on the demodulated signals to generate an uncompressed main AV content, and then, provides the generated uncompressed main AV content to the video display device **100** in operation S306.

Moreover, the content providing server **10** also broadcasts a broadcast signal including a main AV content through a wireless channel in operation S307.

Additionally, the MVPD **30** may directly transmit a broadcast signal including a main AV content to the video display device **100** without going through the broadcast receiving device **60** in operation S308.

The video display device **100** may receive an uncompressed main AV content through the broadcast receiving device **60**. Additionally, the video display device **100** may receive a broadcast signal through a wireless channel, and then, may demodulate and decode the received broadcast signal to obtain a main AV content. Additionally, the video display device **100** may receive a broadcast signal from the MVPD **30**, and then, may demodulate and decode the received broadcast signal to obtain a main AV content. The video display device **100** extracts watermark information from audio samples in some frames or periods of the obtained

16

main AV content. If watermark information corresponds to a logo, the video display device **100** confirms a watermark server address corresponding to a logo extracted from a corresponding relationship between a plurality of logos and a plurality of watermark server addresses. When the watermark information corresponds to the logo, the video display device **100** cannot identify the main AV content only with the logo. Additionally, when the watermark information does not include content information, the video display device **100** cannot identify the main AV content but the watermark information may include content provider identifying information or a watermark server address. When the watermark information includes the content provider identifying information, the video display device **100** may confirm a watermark server address corresponding to the content provider identifying information extracted from a corresponding relationship between a plurality of content provider identifying information and a plurality of watermark server addresses. In this manner, when the video display device **100** cannot identify a main AV content the video display device **100** only with the watermark information, it accesses the watermark server **21** corresponding to the obtained watermark server address to transmit a first query in operation S309.

The watermark server **21** provides a first reply to the first query in operation S311. The first reply may include at least one of a fingerprint server address, content information, enhanced service information, and an available enhanced service. The content information and enhanced service information are described above.

If the watermark information and the first reply include a fingerprint server address, the video display device **100** extracts feature information from some frames or a certain section of audio samples of the main AV content in operation S313.

The video display device **100** accesses the fingerprint server **22** corresponding to the fingerprint server address in the first reply to transmit a second query including the extracted feature information in operation S315.

The fingerprint server **22** provides a query result as a second reply to the second query in operation S317.

If the query result does not include an enhanced service address or enhanced service but includes an enhanced service address providing server address, the video display device **100** accesses the enhanced service information providing server **40** corresponding to the obtained enhanced service address providing server address to transmit a third query including content information in operation S319.

The enhanced service information providing server **40** searches at least one available enhanced service relating to the content information of the third query. Later, the enhanced service information providing server **40** provides to the video display device **100** enhanced service information for at least one available enhanced service as a third reply to the third query in operation S321.

If the video display device **100** obtains at least one available enhanced service address through the first reply, the second reply, or the third reply, it accesses the at least one available enhanced service address to request enhanced service in operation S323, and then, obtains the enhanced service in operation S325.

Then, referring to FIGS. 10 and 18, the video display device **100** will be described according to an embodiment.

FIG. 10 is a block diagram illustrating the video display device according to the embodiment.

As shown in FIG. 10, the video display device **100** includes a broadcast signal receiving unit **101**, a demodulation unit **103**, a channel decoding unit **105**, a demultiplexing unit **107**,

17

an AV decoding unit **109**, an external input port **111**, a play controlling unit **113**, a play device **120**, an enhanced service management unit **130**, a data transmitting/receiving unit **141**, and a memory **150**.

The broadcast signal receiving unit **101** receives a broadcast signal from the content providing server **10** or MVPD **30**.

The demodulation unit **103** demodulates the received broadcast signal to generate a demodulated signal.

The channel decoding unit **105** performs channel decoding on the demodulated signal to generate channel-decoded data.

The demultiplexing unit **107** separates a main AV content and enhanced service from the channel-decoded data. The separated enhanced service is stored in an enhanced service storage unit **152**.

The AV decoding unit **109** performs AV decoding on the separated main AV content to generate an uncompressed main AV content.

Moreover, the external input port **111** receives an uncompressed main AV content from the broadcast receiving device **60**, a digital versatile disk (DVD) player, a Blu-ray disk player, and so on. The external input port **111** may include at least one of a DSUB port, a High Definition Multimedia Interface (HDMI) port, a Digital Visual Interface (DVI) port, a composite port, a component port, and an S-Video port.

The play controlling unit **113** controls the play device **120** to play at least one of an uncompressed main AV content that the AV decoding unit **109** generates and an uncompressed main AV content received from the external input port **111** according to a user's selection.

The play device **120** includes a display unit **121** and a speaker **123**. The display unit **21** may include at least one of a liquid crystal display (LCD), a thin film transistor-liquid crystal display (TFT LCD), an organic light-emitting diode (OLED), a flexible display, and a 3D display.

The enhanced service management unit **130** obtains content information of the main AV content and obtains available enhanced service on the basis of the obtained content information. Especially, as described above, the enhanced service management unit **130** may obtain the identification information of the main AV content on the basis of some frames or a certain section of audio samples the uncompressed main AV content. This is called automatic contents recognition (ACR) in this specification.

The data transmitting/receiving unit **141** may include an Advanced Television Systems Committee-Mobile/Handheld (ATSC-M/H) channel transmitting/receiving unit **141a** and an IP transmitting/receiving unit **141b**.

The memory **150** may include at least one type of storage medium such as a flash memory type, a hard disk type, a multimedia card micro type, a card type memory such as SD or XD memory, Random Access Memory (RAM), Static Random Access Memory (SRAM), Read-Only Memory (ROM), Electrically Erasable Programmable Read-Only Memory (EEPROM), Programmable Read-Only Memory (PROM), magnetic memory, magnetic disk, and optical disk. The video display device **100** may operate in linkage with a web storage performing a storage function of the memory **150** in the Internet.

The memory **150** may include a content information storage unit **151**, an enhanced service storage unit **152**, a logo storage unit **153**, a setting information storage unit **154**, a bookmark storage unit **155**, a user information storage unit **156**, and a usage information storage unit **157**.

The content information storage unit **151** stores a plurality of content information corresponding to a plurality of feature information.

18

The enhanced service storage unit **152** may store a plurality of enhanced services corresponding to a plurality of feature information or a plurality of enhanced services corresponding to a plurality of content information.

The logo storage unit **153** stores a plurality of logos. Additionally, the logo storage unit **153** may further store content provider identifiers corresponding to the plurality of logos or watermark server addresses corresponding to the plurality of logos.

The setting information storage unit **154** stores setting information for ACR.

The bookmark storage unit **155** stores a plurality of bookmarks.

The user information storage unit **156** stores user information. The user information may include at least one of at least one account information for at least one service, regional information, family member information, preferred genre information, video display device information, and a usage information range. The at least one account information may include account information for a usage information measuring server and account information of social network service such as Twitter and Facebook. The regional information may include address information and zip codes. The family member information may include the number of family members, each member's age, each member's sex, each member's religion, and each member's job. The preferred genre information may be set with at least one of sports, movie, drama, education, news, entertainment, and other genres. The video display device information may include information such as the type, manufacturer, firmware version, resolution, model, OS, browser, storage device availability, storage device capacity, and network speed of a video display device. Once the usage information range is set, the video display device **100** collects and reports main AV content watching information and enhanced service usage information within the set range. The usage information range may be set in each virtual channel. Additionally, the usage information measurement allowable range may be set over an entire physical channel.

The usage information providing unit **157** stores the main AV content watching information and the enhanced service usage information, which are collected by the video display device **100**. Additionally, the video display device **100** analyzes a service usage pattern on the basis of the collected main AV content watching information and enhanced service usage information, and stores the analyzed service usage pattern in the usage information storage unit **157**.

The enhanced service management unit **130** may obtain the content information of the main AV content from the fingerprint server **22** or the content information storage unit **151**. If there is no content information or sufficient content information, which corresponds to the extracted feature information, in the content information storage unit **151**, the enhanced service management unit **130** may receive additional content information through the data transmitting/receiving unit **141**. Moreover, the enhanced service management unit **130** may update the content information continuously.

The enhanced service management unit **130** may obtain available enhanced service from the enhanced service providing server **50** or the enhanced service storage unit **153**. If there is no enhanced service or sufficient enhanced service in the enhanced service storage unit **153**, the enhanced service management unit **130** may update enhanced service through the data transmitting/receiving unit **141**. Moreover, the enhanced service management unit **130** may update the enhanced service continuously.

The enhanced service management unit **130** may extract a logo from the main AV content, and then, may make a query

to the logo storage unit **155** to obtain a content provider identifier or watermark server address, which corresponds to the extracted logo. If there is no logo or a sufficient logo, which corresponds to the extracted logo, in the logo storage unit **155**, the enhanced service management unit **130** may receive an additional logo through the data transmitting/receiving unit **141**. Moreover, the enhanced service management unit **130** may update the logo continuously.

The enhanced service management unit **130** may compare the logo extracted from the main AV content with the plurality of logos in the logo storage unit **155** through various methods. The various methods may reduce the load of the comparison operation.

For example, the enhanced service management unit **130** may perform the comparison on the basis of color characteristics. That is, the enhanced service management unit **130** may compare the color characteristic of the extracted logo with the color characteristics of the logos in the logo storage unit **155** to determine whether they are identical or not.

Moreover, the enhanced service management unit **130** may perform the comparison on the basis of character recognition. That is, the enhanced service management unit **130** may compare the character recognized from the extracted logo with the characters recognized from the logos in the logo storage unit **155** to determine whether they are identical or not.

Furthermore, the enhanced service management unit **130** may perform the comparison on the basis of the contour of the logo. That is, the enhanced service management unit **130** may compare the contour of the extracted logo with the contours of the logos in the logo storage unit **155** to determine whether they are identical or not.

Hereinafter, referring to FIGS. **11** and **18**, the enhanced service management unit **130** will be described according to various embodiments.

FIG. **11** is a hierarchy diagram of an enhanced service management unit according to an embodiment.

As shown in FIG. **11**, the enhanced service management unit **130** may include an operating system **131a**, an audio driver **132a**, a video driver **133a**, a network driver **134a**, an ACR platform application program interface (API) **135a**, at least one ACR engine **136a**, an ACR daemon **137a**, an ACR middleware **138a**, and at least one ACR application **139a**.

When the enhanced service management unit **130** is used as shown in FIG. **11**, a user doesn't need to necessarily recognize a channel or content and an ACR operation may be performed always.

The enhanced service management unit **130** may access an application store through the data transmitting/receiving unit **141** to download application.

The audio driver **132a** may access an audio buffer used for audio fingerprint or audio watermark.

The video driver **133a** may access a video buffer used for video fingerprint or video watermark.

The network driver **134a** allows the ACR engine **136a** to access the data transmitting/receiving unit **141**.

The platform API **135a** provides API to allow the ACR engine **136a** to access the audio driver **132a**, the video driver **133a**, and the network driver **134a**.

Since a plurality of broadcasting stations or content providers use respectively different content recognizing services, the video display device **100** may include a plurality of ACR engines **136a**. That is, the video display device **100** may include an ACR engine for at least one of a plurality of video watermark extraction algorithms, a plurality of audio watermark extraction algorithms, a plurality of video signature extraction algorithms, and a plurality of audio signature

extraction algorithms. The watermark based ACR engine **136a** may extract watermark information, and then, may obtain at least one of a watermark purpose, content information, enhanced service information, and an available enhanced service from the extracted watermark information. The fingerprint based ACR engine **136a** may extract feature information of a certain section of a main AV content, and then, may obtain at least one of content information, enhanced service information, and an available enhanced service on the basis of the extracted feature information.

The ACR daemon **137a** manages at least one ACR engine **136a**. The daemon is executed continuously to process a periodic service request. The daemon appropriately delivers the collected requests to allow another program to process them. The ACR daemon **137a** may manage the execution and termination of the ACR engine **136a**. The ACR daemon **137a** searches an ACR engine matching to a current main AV content among a plurality of ACR engines **136a**. Especially, if a system resource is consumed greatly because several ACR engines are executed, the ACR daemon **137a** sequentially executes the plurality of ACR engines **136a** one by one according to a specific rule or priority to confirm whether content recognition is successful. Additionally, if one of the plurality of ACR engines **136a** is successful in content recognition, the ACR daemon **137a** obtains and executes an ACR application **139a** corresponding to an enhanced service for the recognized content. While the ACR engine **136a** performs the content recognition successfully, if contents are not recognized any more due to a channel change, the ACR daemon **137a** may terminate the ACR application **139a**.

The ACR middleware **138a** serves as a browser for at least one ACR application **139a**.

The ACR application **139a** may provide user experience enhanced by ACR to a user. The ACR application **139a** may be an application downloaded from an application store or the Internet or may be a simple Uniform Resource Locator (URL). The ACR application **139a** may provide content target advertisement, a content provider portal service, a program specific service such as electronic program guide (EPG), or a content provider specific service. While the ACR application **139a** interact with the ACR engine **136a** through the ACR application, it receives content information or signature from the ACR engine **136a** and additionally obtains an enhanced service corresponding to the content information or signature to play them in the play device **120**. For this, an ACR application interface that the ACR application **139a** uses is shown in Table 3 below.

TABLE 3

	Name	description
Method	String getContentID()	Return recognized content id, or undefined if content has not been recognized.
	Date getTiming()	Return time stamp, or undefined if content has not been recognized or time stamp is unavailable.
	String getSignature()	Return the signature captured, or undefined if capturing of the signature has failed.

FIG. **12** is a flowchart illustrating an operation of an enhanced service management unit according to an embodiment.

When the broadcast receiving device **60** and the video display device **100** are turned on and the external input port

21

111 of the video display device 100 is selected, the ACR daemon 137a obtains the content information of a main AV content broadcasted in a tuned channel through at least one ACR engine 136a in operation S401.

Then, the ACR daemon 137a obtains an available enhanced service relating to the content information in operation S403.

The ACR daemon 137a executes the obtained enhanced service in background in operation S405.

The ACR daemon 137a displays a color button on the display unit 121 to notify a user that enhanced service is available in operation S407.

When the ACR daemon 137a receives the use of the enhanced service, it plays the enhanced service executed in background in the play device 120 in operation S409.

If a change or main AV content is changed, the ACR daemon 137a recognizes a change through at least one ACR engine 136a and terminates the enhanced service in operation S411.

FIG. 13 is a hierarchy diagram of an enhanced service management unit according to an embodiment.

As shown in FIG. 13, the enhanced service management unit 130 may include an operating system 131b, an audio driver 132b, a video driver 133b, a network driver 134b, an ACR platform application program interface (API) 135b, at least one ACR engine 136b, an ACR engine management unit 137b, an ACR middleware 138b, and at least one ACR application 139b.

When the enhanced service management unit 130 is used as shown in FIG. 13, a user may need to necessarily recognize a channel or content. However, since the number of queries for ACR may be reduced, server overhead may be decreased.

The audio driver 132b, the video driver 133b, the network driver 134b, the ACR platform API 135b, the at least one ACR engine 136b, and the ACR middleware 138b in the enhanced service management unit 130 of FIG. 13 are identical or similar to those 132a, 133a, 134a, 135a, 136a, and 138a in the enhanced service management unit 130 FIG. 11. Therefore, their detailed descriptions will be omitted.

The ACR engine management unit 137b manages a list of at least one ACR engine 136b and provides a selection interface of the ACR engine 136b to the ACR application 139b.

The ACR application 139b may provide user experience enhanced by ACR to a user. The ACR application 139b may be an application downloaded from an application store or the Internet or may be a simple Uniform Resource Locator (URL). The ACR application 139b may provide content target advertisement, a content provider portal service, a program specific service such as electronic program guide (EPG), or a content provider specific service.

While the ACR application 139b interacts with the ACR engine management unit 137b through the ACR application interface of the ACR middleware 138b, it may select the ACR engine 136b to be used. For this, the ACR application interface that the ACR application 139b uses is shown in Table 4 and Table 5 below.

TABLE 4

	Name	description
Property	readonly ACRCollection acrCollection	List of ACR engines installed in the Receiver
Method	ACR getACR(String acrId)	Return an ACR object matched with ACR Id, or undefined if no item matched is found. The argument acrid means the

22

TABLE 4-continued

	Name	description
	ACRCollection getAllACR()	unique identifier of the ACR engine/solution. Return the whole set of ACR objects installed in the Receiver, or undefined if no ACR is present at the Receiver.

TABLE 5

	Name	description
Property	readonly Integer length	The number of ACR engines in the collection
Method	ACR item(Integer index)	Return the ACR object at position index in the collection, or undefined if no item is present at that position. The argument index means the index of the item that shall be returned.

While the ACR application 139b interacts with the ACR engine 136b through the ACR application interface of the ACR middleware 138b, it controls the ACR engine 136b, and receives content information or signature from the ACR engine 136b to additionally obtain an enhanced service corresponding to the content information or signature. Then, the ACR application 139b plays them in the play device 120. For this, the ACR application interface that the ACR application 139b uses is shown in Table 6 below.

TABLE 6

	Name	description
Property	readonly String acrId readonly String name readonly String description readonly Integer acrType readonly Integer acrComponent readonly String contentId readonly Date timing function onSignatureCaptured(String signature)	the unique id of the ACR engine short name of ACR engine Description of ACR engine FP or WM components used for ACR (audio, video and both) for WM for WM

FIG. 14 is a flowchart illustrating an operation of an enhanced service management unit according to an embodiment.

Although the broadcast receiving device 60 and the video display device 100 are turned on and the external input port 111 of the video display device 100 is selected, the video display device 100 may not perform automatic content recognition before the ACR application 139b is executed.

Once the corresponding channel related ACR application 139b is executed by a user recognizing a channel of a main AV content, the ACR application 139b queries and information on the ACR engine 136b that it uses to the ACR engine management unit 137b and receives it in operation S501.

Then, the ACR application 139b starts the ACR engine 136b that it uses in operation S503 and obtains content information through the ACR engine 136b in operation S505.

The ACR application 139b obtains an available enhanced service relating to a main AV content through the obtained content information in operation S507, and displays a color button on the display unit 121 to notify a user that an enhanced service is available in operation S509.

When the ACR application 139b receives the use of the enhanced service, it plays the enhanced service in the play device 120 in operation S511.

When the ACR middleware 138b receives a user input relating to the termination of the ACR application 139b, it terminates the ACR application 139b in operation S513.

FIG. 15 is a hierarchy diagram of an enhanced service management unit according to an embodiment.

As shown in FIG. 15, the enhanced service management unit 130 may include an operating system 131c, an audio driver 132c, a video driver 133c, a network driver 134c, an ACR platform API 135c, an ACR engine 136c, an ACR middleware 138c, and at least one ACR application 139c.

When the enhanced service management unit 130 is used as shown in FIG. 15, a user may need to necessarily recognize a channel or content. However, since the number of queries for ACR may be reduced, server overhead may be decreased.

The audio driver 132c, the video driver 133c, the network driver 134c, the ACR platform API 135c, and the ACR middleware 138c in the enhanced service management unit 130 of FIG. 15 are identical or similar to those 132a, 133a, 134a, 135a, and 138a in the enhanced service management unit 130 FIG. 11. Therefore, their detailed descriptions will be omitted.

The ACR engine 136c extracts feature information from some frames or a certain section of audio samples of a main AV content to transmit a query including the extracted feature information to an ACR adjustment server (not shown). The

ACR adjustment server may transmit a fingerprint server address in response to the query. Additionally, the ACR adjustment server may transmit content information corresponding to the feature information together with the fingerprint server address.

When receiving the fingerprint server address from the ACR engine 136c, the ACR application 139c directly transmit a query, which includes the feature information that the ACR engine 136c extracts, to the fingerprint server corresponding to the fingerprint server address. For this, the ACR application interface that the ACR application 139c uses is shown in Table 11 below.

TABLE 11

	Name	Description
Property	ReadOnly String signature	For fingerprint,
	function (String signature) onSignatureCaptured	For fingerprint, function pointer: pointed function will return signature value from lower ACREngine, event driven
Method	Boolean getSignature()	For fingerprint, asynchronous call to get signature, will use onSignatureCaptured
	Boolean getContentID()	For watermark, Return recognized content id, or undefined if content has not been recognized.
	Boolean resetACREngine()	When getSignature fails several times(ch change), app will give control to ACREngine to query back to ACRCordinator.
	String getACRBackend()	Return ACRBackend URL

Thus, one example of a fingerprint sample code using such an ACR application interface is shown in Table 12.

TABLE 12

FIG. 16 is a flowchart illustrating an operation of an enhanced service management unit according to an embodiment.

When the broadcast receiving device **60** and the video display device **100** are turned on and the external input port **111** of the video display device **100** is selected, the ACR engine **136c** extracts feature information from some frames or a certain section of audio samples of a main AV content to transmit a query including the extracted feature information to an ACR adjustment server (not shown) in operation **S601**.

The ACR engine **136c** receives a fingerprint server address in response to the query in operation **S603**.

The ACR application **139c** obtains the fingerprint server address from the ACR engine **136c** through a `getACRBackend()` method.

The ACR application **139c** obtains feature information of a certain video frame section or a certain audio section of a main AV content from the ACR engine **136c** through a `getSignature()` method in operation **S607**.

The ACR application **139c** transmits a query, which includes the obtained feature information, to a fingerprint server corresponding to the obtained fingerprint server address in operation **S609**.

The ACR application **139c** receives content information in response to the query in operation **S611**.

The ACR application **139c** obtains an available enhanced service on the basis of the obtained content information in operation **S613**, and displays a color button on the display unit **121** to notify a user that an enhanced service is available in operation **S615**.

When the ACR application **139c** receives the use of the enhanced service, it plays the enhanced service in the play device **120** in operation **S617**.

When the ACR middleware **138c** receives a user input relating to the termination of the ACR application **139c**, it terminates the ACR application **139c** in operation **S619**.

FIG. **17** is a hierarchy diagram of an enhanced service management unit according to an embodiment.

As shown in FIG. **17**, the enhanced service management unit **130** may include an operating system **131d**, an audio driver **132d**, a video driver **133d**, a network driver **134d**, an ACR platform API **135d**, at least one ACR engine **136d**, an ACR engine management unit **137d**, an application management unit **138d**, and at least one ACR application **139d**.

When the enhanced service management unit **130** is used as shown in FIG. **17**, a user doesn't need to necessarily recognize a channel or content and an ACR operation may be performed always.

The audio driver **132d**, the video driver **133d**, the network driver **134d**, the ACR platform API **135d**, and the plurality of ACR engines **136d** in the enhanced service management unit **130** of FIG. **17** are identical or similar to those **132a**, **133a**, **134a**, **135a**, and **136a** in the enhanced service management unit **130** FIG. **11**. Therefore, their detailed descriptions will be omitted.

The ACR engine management unit **137d** confirms that the ACR engine **136d** matches to the main AV content received from the external input port **111** and confirms that the ACR engine **136d** matches to the application **139d**. At this point, the ACR engine management unit **137d** controls the plurality of ACR engines **136d** to simultaneously or sequentially perform watermark extraction or query transmission. The ACR engine management unit **137d** controls the plurality of ACR engines **136d** through priority. If one of the plurality of ACR engines **136d** is successful in recognizing a main AV content, the ACR engine management unit **137d** puts the remaining ACR engines in sleep mode and obtains the content information of the main AV content from the operating ACR engine.

While the application management unit **138d** interacts with the ACR engine management unit **137d**, it controls generation, start, stop, sleep, and termination of the ACR application.

The ACR application **139d** may be a built-in application. The ACR application **139d** may control the ACR engine **136b** through functions shown in Table 13.

TABLE 13

Name	
Function calls	char *getContentID() Date getTiming() char *getSignature() Boolean registerEventListener(EvtType evtType, Boolean (*eventListener)(EvtType evtType, char *contentId, Date *timing, char *signature));
Data Structure	struct Date { int year; int month; int day; int hour; int minute; int second; int msecond; }; typedef enum EvtType { EVT_PROGRAM_CHANGED, EVT_CHANNEL_CHANGED, EVT_ALL };

FIG. **18** is a flowchart illustrating an operation of an enhanced service management unit according to an embodiment.

When the broadcast receiving device **60** and the video display device **100** are turned on and the external input port **111** of the video display device **100** is selected, the ACR engine management unit **137d** confirms that the ACR engine **136a** matches to the main AV content received from the external input port **111** in operation **S701**. At this point, the ACR engine management unit **137d** controls the plurality of ACR engines **136d** to simultaneously or sequentially perform watermark extraction or query transmission. The ACR engine management unit **137d** controls the plurality of ACR engines **136d** through priority.

If one of the plurality of ACR engines **136d** is successful in recognizing a main AV content, the ACR engine management unit **137d** puts the remaining ACR engines in sleep mode in operation **S702**, and obtains the content information of the main AV content from the operating ACR engine in operation **S703**.

Then, the ACR engine management unit **137d** confirms an available application relating to content information in operation **S704**, and requests the execution of the confirmed application **139d** to the application management unit **138d**.

The application management unit **138d** executes the confirmed application **139d** in background in operation **S705**.

The application **139d** executed in background displays a color button on the display unit **121** to notify a user that enhanced service is available in operation **S707**.

When the application **139d** executed in background receives the use of the enhanced service from a user, it plays the enhanced service in the play device **120** in operation **S709**.

If a channel or main AV content is changed in operation **S710**, the ACR engine management unit **137d** confirms the ACR engine **136a** matching to the application **139d** and connects the confirmed ACR engine **136a** to the application **139d** in operation **S711**. At this point, the ACR engine management

29

unit **137d** controls the plurality of ACR engines **136d** to simultaneously or sequentially perform watermark extraction or query transmission.

If the application management unit **138d** receives a user input for the termination of the application **139d** in operation **S712**, it terminates the application **139d** in operation **S713**.

Then, referring to FIGS. **19** and **20**, a method of synchronizing a play time of a main AV content with a play time of an enhanced service according to an embodiment will be described.

Then, referring to FIGS. **19** and **20**, a method of synchronizing a play time of a main AV content with a play time of an enhanced service according to an embodiment will be described.

Enhanced service information may include a start time of an enhanced service. At this point, the video display device **100** may need to start the enhanced service at the start time. However, since the video display device **100** receives a signal transmitting an uncompressed main AV content with no time stamp, the reference time of a plying time of the main AV content is different from that of a start time of the enhanced service. Although the video display device **100** receives a main AV content having time information, the reference time of a plying time of the main AV content may be different from that of a start time of the enhanced service, like rebroadcasting. Accordingly, the video display device **100** may need to synchronize the reference time of the main AV content with that of the enhanced service. Especially, the video display device **100** may need to synchronize the play time of the main AV content with the start time of the enhanced service.

First, the enhanced service management unit **130** extracts a certain section of a main AV content in operation **S801**. The section of the main AV content may include at least one of some video frames or a certain audio section of the main AV content. Time that the enhanced service management unit **130** extracts the section of the main AV content is designated as T_n .

The enhanced service management unit **130** obtains content information of a main AV content on the basis of the extracted section. In more detail, the enhanced service management unit **130** decodes information encoded with invisible watermark in the extracted section to obtain content information. Additionally, the enhanced service management unit **130** may extract feature information in the extracted section, and obtain the content information of the main AV content from the fingerprint server **22** or the content information storage unit **151** on the basis of the extracted feature information. Time that the enhanced service management unit **130** obtains the content information is designated as T_m .

Moreover, the content information includes a start time T_s of the extracted section. After the content information acquisition time T_m , the enhanced service management unit **130** synchronizes the play time of the main AV content with the start time of the enhanced service on the biases of T_s , T_m , and T_n . In more detail, the enhanced service management unit **130** regards the content information acquisition time T_m as a time T_p calculated by the following Equation 1.

$$T_p = T_s + (T_m - T_n) \quad [\text{Equation 1}]$$

Additionally, the enhanced service management unit **130** regards a time of when T_x elapses after the content information acquisition time as $T_p + T_x$.

Then, the enhanced service management unit **130** obtains an enhanced service and its start time T_a on the obtained content information in operation **S807**.

If the synchronized play time of the main AV content is identical to the start time T_a of the enhanced service, the

30

enhanced service management unit **130** starts the obtained enhanced service in operation **S809**. In more detail, the enhanced service management unit **130** may start the enhanced service when the following Equation 2 is satisfied.

$$T_p + T_x = T_a \quad [\text{Equation 2}]$$

FIG. **20** is a conceptual diagram illustrating a method of synchronizing a play time of a main AV content with a play time of an enhanced service according to an embodiment.

As shown in FIG. **20**, the video display device **100** extracts an AV sample during a system time T_n .

The video display device **100** extracts feature information from the extracted AV sample, and transmits a query including the extracted feature information to the fingerprint server **22** to receive a query result. The video display device **100** confirms whether a start time T_s of the extracted AV sample corresponds to 11000 ms at T_m by parsing the query result.

Accordingly, the video display device **100** regards the time of when the start time of the extracted AV sample is confirmed according to Equation 1 as $T_s + (T_m - T_n)$, so that, after that, the play time of the main AV content may be synchronized with the start time of the enhanced service.

Next, an ACR application will be described according to various embodiments with reference to FIGS. **21** to **50**.

The ACR application may include an auto playing application, a content provider application, and a video display manufacturer application.

FIG. **21** is a screen when an auto playing application is executed according to an embodiment.

The auto playing application automatically plays an enhanced service even when a user makes no action. In this sense, the auto playing application is designated as a lean back application in this specification.

The auto playing application automatically plays an enhanced service such as scene related information that a content provider or broadcasting station provides during playing of the main AV content according to a play time of the main AV content, without a user's input. That is, a content provider or broadcasting station entirely controls the auto playing application.

As shown in FIG. **21**, once the auto playing application is executed, the screen **200** may include a sub screen **210** where a reduced main AV content is played and a sub screen **220** where additional information is displayed. The sub screen **200** where additional information is displayed may be spatially separated from the sub screen **210** where a main AV content is played.

Moreover, when an auto playing application is executed, an area where additional information is displayed may be semi-transparent. In this case, the area where additional information is displayed may overlay on an area where a main AV content played.

FIG. **22** is a screen when a content provider application is executed according to an embodiment.

In this specification, the content provider application is designated as a full interactive application.

As shown in FIG. **22** (A), the video display device **100** downloads and stores a plurality of applications. FIG. **22** (A) illustrates icons **230** of the applications. A content provider application among the plurality of applications is an application created and distributed by a content provider, and thus, may be under control of the content provider.

A user of the video display device **100** may download a content provider application from an application store and determines whether to execute the downloaded content provider application.

31

FIG. 22 (B) is a screen when a content provider application is executed. As shown in FIG. 22 (B), the screen 200 may include the sub screen 210 where a reduced main AV content is played and the sub screen 220 where additional information is displayed.

Hereinafter, a video display device manufacturer application will be described according to an embodiment with reference to FIGS. 23 to 50.

The video display device manufacturer application is created and controlled by a video display device manufacturer, and may be stored in advance when the video display device 100 is manufactured. That is, the video display device manufacturer application may provide the same service and user interface regardless of a content provider or content.

The video display device manufacturer application may include an area where an enhanced service that a content provider provides is displayed and an area where an enhanced service that a video display device manufacturer provides is displayed, separately. A user of the video display device 100 may determine whether to execute the video display device manufacturer application.

The video display device manufacturer application may have two types.

The video display device manufacturer application of the first type has a resizing user interface. The video display device manufacturer application having the resizing user interface reduces the size of an area where a main AV content is displayed to display all the main AV content in a reduced area. Additionally, the video display device manufacturer application having the resizing user interface reshapes an area where an application is displayed with an L or inverse-L shaped structure.

The video display device manufacturer application of the second type has an overlay user interface. The video display device manufacturer application having the overlay user interface maintains the size of an area where a main AV content is displayed, and overlaps an area where an application is displayed on the main AV content. Since the area where an application is displayed covers the main AV content, an application area may be semi-transparent.

FIG. 23 is a screen when a video display device manufacturer application having a resizing user interface is executed according to an embodiment.

As shown in FIG. 23, the screen 300 of when a video display device manufacturer application having a resizing user interface is executed includes a main content area 310 where a main AV content is displayed, a main menu area 320 where a main menu is displayed, a notification area 330 where a notification message is displayed, a control button area 340 where a control button is displayed to control the video display device manufacturer application, a sub menu area 350 where a sub menu is displayed, an additional information area 360 where additional information is displayed, and an advertisement area 370 where advertisement is displayed.

The control button area 340 includes an ending button 341 for ending the video display device manufacturer application, a hiding button 342 for hiding the video display device manufacturer application, and a back button 343 for returning to previous information.

In the video display device manufacturer application having the resizing user interface, the main AV content area 310 is disposed on the top-left of the screen 300; the main menu area 320 and the notification area 330 is disposed on the bottom of the main AV content area 310; the control button area 340 is disposed on the top-left; the sub menu area 350 is disposed between the control button area 340 and the additional information area 360; the advertisement area 370 is

32

disposed on the bottom-right; and the additional information area 360 is disposed between the sub menu area 350 and the advertisement area 370. However, their positions may vary.

FIG. 24 is a screen when a video display device manufacturer application having an overlay user interface is executed according to an embodiment.

As shown in FIG. 24, like the video display device manufacturer application having the resizing user interface, the screen 300 of when the video display device manufacturer application having the overlay user interface is executed includes a main content area 310 where a main AV content is displayed, a main menu area 320 where a main menu is displayed, a notification area 330 where a notification message is displayed, a control button area 340 where a control button is displayed to control the video display device manufacturer application, a sub menu area 350 where a sub menu is displayed, an additional information area 360 where additional information is displayed, and an advertisement area 370 where advertisement is displayed.

In the video display device manufacturer application having the overlay user interface, the main AV content area 310 is disposed on the top-left of the screen 300; the main menu area 320 and the notification area 330 is disposed on the bottom of the main AV content area 310; the control button area 340 is disposed on the top-left; the sub menu area 350 is disposed between the control button area 340 and the additional information area 360; the advertisement area 370 is disposed on the bottom-right; and the additional information area 360 is disposed between the sub menu area 350 and the advertisement area 370. However, their positions may vary.

Hereinafter, a video display device manufacturer application having a resizing user interface will be mainly described.

The video display device manufacturer application receives necessary information from an ACR engine built in the video display device 100 and has two types of menus largely according to its character.

The first type menu is for a time insensitive enhanced service. That is, when a menu relating to the time insensitive enhanced service is selected, the video display device 100 obtains an identifier of a main AV content that is currently played on a screen, obtains an enhanced service on the basis of the obtained identifier, and displays the obtained enhanced service on the additional information area 360. Examples of such a time insensitive enhanced service includes titles, genres, actors, directors, and other people's evaluations, short clips, and short explanations. Through this basic information, the video display device 100 may search additional information, link to a social network service such as Facebook and Twitter, or provide a recommended service and a related advertisement.

The second type menu is for a time sensitive enhanced service. That is, when a menu relating to the time sensitive enhanced service is selected, the video display device 100 obtains an identifier and play time information of a main AV content that is currently played on a screen, obtains a time sensitive enhanced service on the basis of the obtained identifier and play time information, and displays the obtained enhanced service on the additional information area 360.

The main menu of the video display device manufacturer application includes a program menu, an information menu, a social menu, a recommendation menu, and a catalogue menu. Among these, the time insensitive menu includes the information menu, the social menu, the recommendation menu, and the catalogue menu, and the time sensitive menu includes the program menu. If the time insensitive menu is selected, the time sensitive application may be called. Other than these five main menus, other main menus may be added. If each

33

main menu is selected, a sub menu of the selected main menu is displayed on the sub menu area **350**.

FIG. **25** is a flowchart illustrating a method of executing a video display device manufacturer application according to an embodiment.

When receiving a user input corresponding to an application selection menu display through pressing of a specific key of a remote controller, shaking of a motion remote controller in a downward direction, zooming of the cursor of a motion remote controller in the bottom direction of the screen while a main AV content is played in operation **S901**, the video display device **100** displays an application selection menu of FIG. **26** in operation **S903**.

FIG. **26** is a screen when an application selection menu is displayed according to an embodiment.

As shown in FIG. **26**, the application selection menu **380** is disposed at the bottom of the screen **300**. The application selection menu **380** may be semi-transparent.

The application selection menu **380** includes execution icons of a plurality of applications installed in the video display device **100**. One icon of the displayed execution icons corresponds to the execution icon of the video display device manufacturer application.

When receiving a user input corresponding to an icon selection of the video display device manufacturer application through manipulating of the left and right arrow keys in a remote controller or moving of the cursor according to a movement of a motion remote controller in operation **S905**, the video display device **100** executes the video display device manufacturer application in operation **S907**. Through this, a user may immediately execute the application if he/she wants without access to an application store while watching a main AV content.

Once the video display device manufacturer application is executed, its main menu is displayed. If a program menu is selected by default, its sub menu is displayed on the sub menu area **350**. An all sub menu is selected by default among the sub menus of the program menu. Focus is made on the all sub menu. As time elapses, an enhanced service displayed on the additional information area **360** is automatically updated. The ← button is used for returning to a previous menu and the X button is used for returning to an entire screen after closing the video display device manufacturer application.

Then, a video display device manufacturer application will be described according to an embodiment with reference to FIGS. **27** to **29**.

The program main menu is a menu for displaying an application, which is time-related to a main AV content that is being played, on the additional information area **360**. Enhanced service information for displaying an application linking with the main AV content may be provided from a content owner such as TV broadcasters. The video display device **100** analyzes the enhanced service information to display a corresponding application in the additional information area **360** at the right timing. UI in a screen is shown in the drawing below.

The program menu includes an all sub menu, a participation sub menu, and a discovery sub menu.

The all sub menu is a menu for displaying all applications related to the participation sub menu and discovery sub menu on the additional information area **360**. The participation sub menu is a menu for displaying an application inducing program participation such as voting in a program. The discovery sub menu is a menu for displaying an application such as scene related information. The sub menu of the program menu may be added or edited according to contents of an application that a content owner wants.

34

FIG. **27** is a screen when an all sub menu of a program main menu in a video display device manufacturer application is selected according to an embodiment.

When the all sub menu, i.e., the first sub menu of the program main menu, is selected, the video display device **100** displays all applications related to the participation sub menu and display sub menu on the additional information area **360**.

When the all sub menu is selected, the video display device **100** displays an application or event synchronized with a specific time on the additional information area **360**. If there is no application synchronized with a specific time, the video display device **100** may leave the additional information area **350** as empty space. However, since the empty space may not give motivation for additional interaction to a user, if there is no application synchronized with a specific time, the video display device **100** may gather applications or events that occur prior to now in order to display a history.

When a user enters into the video display device manufacturer application, it may be seen that the user may have an intention to perform an interactive application related to a main AV content while watching the main AV content. While navigating several menus, a user may not watch an event at a specific time. Especially, when a user navigates menus for time insensitive enhanced services, the above case may likely occur. Therefore, after entering into the video display device manufacturer application, if a time sensitive event occurs during navigation, the video display device **100** displays a notification message for this on the notification area **330** to notify a user that there is a special event at the current time broadcasted from a broadcasting station.

While a user confirms music information or place information through the video display device manufacturer application, a time linked application occurs, the video display device **100** displays a notification message on the notification area **330**. When receiving a user input corresponding to the Go To button press, the video display device **100** enters into a sub menu related to an occurring time linked application and displays the occurring time linked application on the additional information area **360**. The notification message may be a text message. Additionally, the video display device **100** may display an amount of the delivered application as a number. The notification message may be delivered to a viewer in a Push method.

FIG. **28** is a screen when a participation sub menu of a program main menu in a video display device manufacturer application is selected according to an embodiment.

As shown in FIG. **28**, once the participation sub menu is selected, the video display device **100** displays an application inducing viewer participation such as voting on the additional information area **360**. If a viewer participation application occurs, the video display device **100** displays it on the additional information area **360**. If the viewer participation application is voting, the video display device **100** may display voting questions and voting results. Moreover, the video display device **100** displays current events and also previous events that the viewer participates on the bottom of the current event, for the viewer's convenience.

FIG. **29** is a screen when a discovery sub menu of a program main menu in a video display device manufacturer application is selected according to an embodiment.

As shown in FIG. **29**, once the discovery sub menu is selected, the video display device **100** displays all time linked applications besides a viewer participation application on the additional information area **360**. For example, the video display device **100** displays scene related information on products or places shown in a main AV content. The video display

35

device **100** may display current scene related information and previous scene related information simultaneously.

Moreover, the video display device **100** may display a notification message that there is a time linked application or event on a sub menu. For example, if a viewer participation application occurs, the video display device **100** displays an icon having a flashing N on the participation sub menu to induce viewer participation. If a user does not respond to the notification for a predetermined time, the video display device **100** may remove the notification.

Hereinafter, an information main menu of a video display device manufacturer application will be described according to an embodiment with reference to FIGS. **30** to **36**.

The information main menu corresponds to a time insensitive area. Like the UI of the program main menu, the information main menu does not operate in a UI manner that an application is automatically displayed and disappears at a specific time. Of course, although the above-mentioned time linked application may be displayed through this menu, when a main menu other than the program main menu is selected, a second service such as search service or Twitter service may be linked.

The information main menu includes a search sub menu, a Twitter sub menu, and a news sub menu.

Then, a search sub menu of an information main menu in a video display device manufacturer application will be described according to an embodiment with reference to FIGS. **30** to **32**.

FIG. **30** is flowchart illustrating a searching method according to an embodiment.

The video display device **100** extracts a certain section of a main AV content and obtains content information on the basis of the extracted section.

Once the search sub menu of an information main menu in a video display device manufacturer application is selected in operation **S1002**, the video display device **100** obtains a search list including a plurality of search items corresponding to an enhanced service on the basis of the obtained content information in operation **S1003**. The search list includes at least one of genres, actors, directors, places, and products.

The video display device **100** displays the search list on the additional information area **360** in operation **S1007**. A display example of the search list will be described with reference to FIG. **30**.

FIG. **31** is a screen when a search sub menu of an information main menu in a video display device manufacturer application is selected according to an embodiment.

As shown in FIG. **31**, the search list includes characters of a main AV content. The video display device **100** may display at least one of pictures or names of a search item on the additional information area **360**.

When one of a plurality of search items is selected through the cursor of a remote controller in operation **S1009**, the video display device **100** searches information on the selected search item in operation **S1011**. At this point, the video display device **100** may use an internet search engine such as Google. Moreover, the video display device **100** may use information such as Tribune media or IMDb.

The video display device **100** displays the searched information on the additional information area **360** in operation **S1013**. Since the searched result is automatically retrieved through programming such as Open API of a service provider, time for a screen design may be greatly saved. A display example of the search information will be described with reference to FIG. **32**.

36

FIG. **32** is another screen when a search sub menu of an information main menu in a video display device manufacturer application is selected according to an embodiment.

As shown in FIG. **32**, the video display device **100** displays a search result for the selected search item on the additional information area **360**. Moreover, the video display device positions a Twitter button and an edit button on the additional information area **360** to follow an actor's Twitter or edit an actor's profile such as filmography or biography.

Like this, if the searching method according to an embodiment is used, information related to a main AV data may be searched through one click, so that an effort to input a search word may be reduced.

Next, a Twitter sub menu of an information main menu in a video display device manufacturer application will be described according to an embodiment with reference to FIGS. **33** to **34**.

FIG. **33** is flowchart illustrating a chatting window displaying method according to an embodiment.

The video display device **100** extracts a certain section of a main AV content and obtains content information on the basis of the extracted section in operation **S1101**.

Once a Twitter sub menu of an information main menu in a video display device manufacturer application is selected in operation **S1102**, the video display device **100** obtains a Twitter chatting list corresponding to an enhanced service on the basis of the obtained content information in operation **S1103**. The video display device **100** writes a program name on Hashtag of Twitter to load a Twitter chatting list related to the program. This chatting list is linked to Twitter and is continuously updated in real time.

The video display device **100** displays one chatting window in the Twitter chatting list on the additional information area **360** through a user selection or automatically in operation **S1107**. A display example of the chatting window will be described with reference to FIG. **34**.

FIG. **34** is a screen when a Twitter sub menu of an information main menu in a video display device manufacturer application is selected according to an embodiment.

As shown in FIG. **34**, the video display device **100** displays a chatting window on the additional information area **360** to support chatting between viewers watching the same program.

When a program is broadcasted, a user of the program may directly write a message in a chatting room actually. If the video display device **100** has a log in mechanism like Smart TV, a user of the video display device **100** may immediately start chatting with his own ID in a logged in state when entering into a menu. If it is inconvenient to make an input to the video display device **100** through a remote controller, the video display device **100** may display only a chatting message. If the video display device **100** is linked to a second device such as Smart Phone or tablet, a message may be typed using the input device of the second device. Although information in Hashtag is a program name basically, it may be selected as a tag of actors or directions, i.e., the above-mentioned another basic information, so that a user may selectively participate in chatting of a corresponding subject.

Next, a news sub menu of an information main menu in a video display device manufacturer application will be described according to an embodiment with reference to FIGS. **35** to **36**.

FIG. **35** is a flowchart illustrating a news obtaining method according to an embodiment.

The video display device **100** extracts a certain section of a main AV content and obtains content information on the basis of the extracted section in operation **S1201**.

37

Once the news sub menu of an information main menu in a video display device manufacturer application is selected in operation S1202, the video display device 100 obtains news corresponding to an enhanced service on the basis of the obtained content information in operation S1203. At this point, the news may or may not relate to a main AV content. Or, the news may be provided from a broadcaster of a main AV content. If the broadcaster does not provide news through Open API, the video display device 100 may receive news through News feeds of an internet service such as Google or Yahoo.

The video display device 100 displays the obtained news on the additional information area 360 in operation S1207. A display example of news will be described with reference to FIG. 36.

FIG. 36 is a screen when a news sub menu of an information main menu in a video display device manufacturer application is selected according to an embodiment.

As shown in FIG. 36, the video display device 100 may display the obtained news on the additional information area 360.

Hereinafter, a social main menu of a video display device manufacturer application will be described according to an embodiment with reference to FIGS. 37 to 42.

The social main menu corresponds to a time insensitive area. Like the UI of the program main menu, the social main menu does not operate in a UI manner that an application is automatically displayed and disappears at a specific time. Of course, although the above-mentioned time linked application may be displayed through this menu, when a main menu other than the program main menu is selected, a second service such as Facebook may be linked.

The social main menu includes a viewer list sub menu and a preference display sub menu.

Then, a viewer list sub menu of a social main menu in a video display device manufacturer application will be described according to an embodiment with reference to FIGS. 37 to 40.

FIG. 37 is flowchart illustrating a viewer list displaying method according to an embodiment.

The video display device 100 extracts a certain section of a main AV content and obtains content information on the basis of the extracted section in operation S1301.

Once a viewer list sub menu of a social main menu in a video display device manufacturer application is selected in operation S1302, the video display device 100 obtains information on a friends list and whether each friend watches a main AV content on the basis of the obtained content information in operation S1303. The video display device 100 may be linked with a social network service such as Facebook to obtain a list of friends watching a main AV content.

The video display device 100 displays the obtained viewer list on the additional information area 360 in operation S1307. A display example of the viewer list will be described with reference to FIG. 38.

FIG. 38 is a screen when a viewer list sub menu of a social main menu in a video display device manufacturer application is selected according to an embodiment.

As shown in FIG. 38, the video display device 100 may display the pictures and names of the viewers corresponding to the obtained viewer list on the additional information area 360.

Especially, the video display device 100 may display a friends list together with whether each friend watches contents or only a list of friends watching contents currently.

38

When one friend is selected from the displayed friends list in operation S1309, the video display device 100 confirms whether the selected friend watches a main AV content in operation S1311.

If the selected friend watches the main AV content, the video display device 100 displays the chatting window of the selected friend on the additional information area 360 in operation S1313.

Additionally, if the selected friend does not watch the main AV content, the video display device 100 sends a message recommending watching the main AV content to the e-mail or mobile phone of the selected friend in operation S1315. Even if the selected friend does not watch the main AV content, the video display device 100 may display the chatting window of the selected friend on the additional information area 360.

For chatting, a user may use the remote controller of the video display device 100 or the input device of the second device connected to the video display device 100, and may chat with friends through a social network service application of a smart phone regardless of the video display device 100. In any cases, a chatting screen of the social network service may be displayed on the screen of the video display device 100. Through buttons for evaluating a program, a user may send his/her intention to friends. For example, a user may notify friends that he/she currently watches a main AV content and may recommend friends who do not watch the main AV content currently to watch it through a "good" button.

Like this, the video display device 100 automatically realizes who is watching which program by using an ACR technique through a viewer list sub menu. In order to confirm who is watching which program, a user needs to log in. Once an account for log in is registered in the video display device 100, each time the video display device 100 is turned on, a user may log in automatically. Therefore, the video display device 100 may realize who is watching a main AV content.

FIG. 39 is a signal flow when a video display device obtains a friends list and watching information according to an embodiment.

As shown in FIG. 39, if a video display device of a friend A plays a main AV content A, it transmits an identifier of the main AV content A and an identifier of the friend A to the SNS providing server 75 in operation S1401.

Additionally, if a video display device of a friend B plays the main AV content A, it transmits an identifier of the main AV content A and an identifier of the friend B to the SNS providing server 75 in operation S1403.

If the video display device 100 plays the main AV content A, it transmits a user ID and an identifier of the main AV content A to the SNS providing server 75 in operation S1405.

The SNS providing server 75 confirms information on a friends list of the video display device 100 and whether each friend watches a main AV content on the basis of the friend relationship information and received content identifiers in operation S1407.

FIG. 40 is a signal flow when a video display device obtains a friends list and watching information according to another embodiment.

As shown in FIG. 40, if a video display device of a friend A plays a main AV content A, it transmits an identifier of the friend A to the SNS providing server 75 in operation S1501, and transmits the main AV content A to the ACR sever in operation S1503. The ACR server 77 may be one of a watermark server 21, a fingerprint server 22, an enhanced service information providing server 40, and an enhanced service providing sever 50.

Additionally, if a video display device of a friend B plays the main AV content A, it transmits an identifier of the friend

B to the SNS providing server **75** in operation **S1505**, and transmits the main AV content A to the ACR sever **77** in operation **S1507**.

The video display device **100** transmits a user ID to the SNS providing server **75** in operation **1509**.

Then, the SNS providing server **75** provides a friend list corresponding to the user ID to the ACR server **75** in operation **S1511**.

Moreover, if the video display device **100** plays the main AV content A, it transmits a user ID and an identifier of the main AV content A to the ACR server **75** in operation **S1513**.

The ACR server **75** confirms information on the friends list of the video display device **100** and whether each friend watches a main AV content on the basis of the friends list corresponding to the user ID and content identifier, and then, provides the confirmed information to the video display device **100** in operation **S1515**.

Then, a preference display sub menu of a social main menu in a video display device manufacturer application will be described according to an embodiment with reference to FIGS. **41** to **42**.

FIG. **41** is flowchart illustrating a preference displaying method according to an embodiment.

The video display device **100** extracts a certain section of a main AV content and obtains content information on the basis of the extracted section in operation **S1601**.

Once a preference display sub menu of a social main menu in a video display device manufacturer application is selected in operation **S1602**, the video display device **100** obtains a preference display list including a plurality of preference display items on the basis of the obtained content information in operation **S1603**. Here, the preference display item may include preview or a preview address. The preview may be an image or a short video. The preview may be directly provided from a broadcaster through Open API, or may be obtained by a search engine of an internet service, or obtained by extracting only a necessary portion from an internet server of a broadcaster. Images corresponding to core scenes of a time interval corresponding to several minutes may be provided or one image for one program may be provided.

The video display device **100** displays the obtained preference display list on the additional information area **360** in operation **S1607**. A display example of the viewer list will be described with reference to FIG. **42**.

FIG. **42** is a screen when a preference display sub menu of a social main menu in a video display device manufacturer application is selected according to an embodiment.

As shown in FIG. **42**, the video display device **100** may display previews in a preference display list and "Like it" buttons for preference display on the additional information area **360**.

Once the "Like it" button corresponding to one preference display item is selected in operation **S1609**, the video display device **100** posts a preview and simple text corresponding to the selected preference display item on SNS such as Facebook in operation **S1611**. Here, the simple text may be automatically generated, or may be inputted through a remote controller or an input device of a second device.

Hereinafter, a recommendation main menu of a video display device manufacturer application will be described according to an embodiment with reference to FIGS. **43** to **46**.

The recommendation main menu corresponds to a time insensitive area. Like the UI of the program main menu, the recommendation main menu does not operate in a UI manner that an application is automatically displayed and disappears at a specific time. Of course, through this menu, the above-

mentioned time linked application may be displayed but if a recommendation menu is selected, another service may be linked.

The recommendation main menu may include a previous episode sub menu, a VOD sub menu, and an application sub menu.

FIG. **43** is flowchart illustrating a digital media downloading method according to an embodiment.

The video display device **100** extracts a certain section of a main AV content and obtains content information on the basis of the extracted section in operation **S1701**.

Once a recommendation main menu of a video display device manufacturer application is selected in operation **S1702**, the video display device manufacturer application obtains a digital media list on the basis of the obtained content information in operation **S1703**. If the previous episode sub menu is selected, the video display device **100** obtains a previous episode list. If the VOD sub menu is selected, the video display device **100** obtains a VOD list that relates to a main AV content or a provider of the main AV content recommends. If the application sub menu is selected, the video display device **100** obtains a VOD list that relates to a main AV content or a provider of the main AV content recommends. Here, the digital media list may include a preview, a preview address, and an icon related image.

The video display device manufacturer application displays the obtained digital media list on the additional information area **360** in operation **S1707**.

An example of a previous episode list is described with reference to FIG. **44**.

FIG. **44** is a screen when a previous episode sub menu of a recommendation main menu in a video display device manufacturer application is selected according to an embodiment.

As shown in FIG. **44**, the video display device **100** displays previews and titles of a previous episode list on the additional information area **360**. Like this, according to an embodiment, the video display device **100** may automatically search and display a previous episode without user's manipulation.

A display example of the VOD list will be described with reference to FIG. **45**.

FIG. **45** is a screen when a VOD sub menu of a recommendation main menu in a video display device manufacturer application is selected according to an embodiment.

As shown in FIG. **45**, the video display device **100** displays previews and titles of a VOD list on the additional information area **360**. Like this, according to an embodiment, the video display device **100** may automatically search and display VOD related to a main AV content without user's manipulation.

A display example of the application list will be described with reference to FIG. **46**.

FIG. **46** is a screen when an application sub menu of a recommendation main menu in a video display device manufacturer application is selected according to an embodiment.

As shown in FIG. **46**, the video display device **100** displays icons and application names of the application list on the additional information area **360**. Like this, according to an embodiment, the video display device **100** may automatically search and display applications related to a main AV content without user's manipulation.

Once one item is selected from the digital media list in operation **S1709**, the video display device manufacturer application downloads a digital media corresponding to the selected item in operation **S1711**. At this point, the video display device **100** may download the digital media after payment. If the selected item is a previous episode or VOD, the video display device **100** may play the downloaded digital

41

media. If the selected item is an application, the video display device may automatically play the downloaded application or may play it through a user's selection.

Like this, according to an embodiment, the video display device may download digital media through simple manipulation.

Hereinafter, a catalog main menu of a video display device manufacturer application will be described according to an embodiment with reference to FIGS. 47 to 50.

The catalog main menu corresponds to a time insensitive area. Like the UI of the program main menu, the catalog main menu does not operate in a UI manner that an application is automatically displayed and disappears at a specific time. Of course, through this menu, the above-mentioned time linked application may be displayed but if a catalog menu is selected, another service may be linked.

The catalog main menu may include a style sub menu, a music sub menu, and another sub menu.

FIG. 47 is flowchart illustrating a catalog displaying method according to an embodiment.

The video display device 100 extracts a certain section of a main AV content and obtains content information on the basis of the extracted section in operation S1801.

Once a sub menu of a catalog main menu in a video display device manufacturer application is selected in operation S1802, the video display device manufacturer application obtains a catalog list on the basis of the obtained content information in operation S1803. If the style sub menu is selected, the video display device 100 obtains a clothing catalog list that relates to a main AV content or a provider of the main AV content recommends. If the music sub menu is selected, the video display device 100 obtains a music catalog list that relates to a main AV content or a provider of the main AV content recommends. If the other sub menu is selected, the video display device 100 obtains a products or places catalog list that relates to a main AV content or a provider of the main AV content recommends. Here, the digital media list may include a related image, price information, description, and coupon. The coupon may be numbers or QR codes. The video display device 100 may display coupons only when a user watches a main AV content, or may allow a user to use it during the available period after storing it on the memory 150.

The video display device manufacturer application displays the obtained catalog list on the additional information area 360 in operation S1807.

A display example of the clothing catalog list will be described with reference to FIG. 48.

FIG. 48 is a screen when a style sub menu of a recommendation main menu in a video display device manufacturer application is selected according to an embodiment.

As shown in FIG. 48, the video display device 100 displays maker information, price information, of description information of clothing related to a main AV content on the additional information area 360. Like this, according to an embodiment, the video display device 100 may automatically search and display a clothing catalog related to a main AV content without user's manipulation.

An example of a music catalog list is described with reference to FIG. 49.

FIG. 49 is a screen when a music sub menu of a recommendation main menu in a video display device manufacturer application is selected according to an embodiment.

As shown in FIG. 49, the video display device 100 displays singer information, price information, and description information of music related to a main AV content on the additional information area 360. Like this, according to an embodiment, the video display device 100 may automatically

42

search and display a music catalog related to a main AV content without user's manipulation.

A display example of another catalog list will be described with reference to FIG. 50.

FIG. 50 is a screen when another sub menu of a recommendation main menu in a video display device manufacturer application is selected according to an embodiment.

As shown in FIG. 50, the video display device 100 displays price information and description information of products and places related to a main AV content on the additional information area 360. Like this, according to an embodiment, the video display device 100 may automatically search and display a products or places catalog related to a main AV content without user's manipulation.

Once one item is selected from the catalog list in operation S1809, the video display device manufacturer application displays a purchase item corresponding to the selected item in operation S1811.

Like this, according to an embodiment, a user may purchase products through simple manipulation.

A post purchase review button and a bookmark button may be disposed at each item in the catalog list.

Once the post purchase review button is selected, the video display device 100 may display a post use review of a product on the additional information area 360. Additionally, a user may write a post purchase review.

Additionally, after bookmarking a specific item through the bookmark button, a user may recommend the bookmarked item through a viewer list sub menu of a social main menu.

In this case, the video display device 100 may provide bookmark item information to the ACR server 77 or SNS providing server 75.

Then, the video display device 100 of a user receiving the recommendation obtains content information on the basis of the extracted section from a main AV content, and may display a recommendation message such as "this product is recommended by a friend U" if the main AV content corresponds to an advertisement of the recommended item on the basis of the obtained content information. Additionally, instead of a recommendation message, a short video may be displayed.

Then, an on/off control of an ACR function will be described according to an embodiment with reference to FIGS. 51 and 52.

FIG. 51 is a view of a user interface for controlling an ACR function according to an embodiment.

As shown in FIG. 51, the play controlling unit 113 displays an ACR function setting window. A user may activate or deactivate the ACR function through the ACR function setting window.

When the ACR function is activated, a user may select an ACR mode. The ACR mode may be set with one of an auto playing application mode, a content provider application mode, and an video display manufacturer application mode.

When the ACR function mode is set in the above manner, the play controlling unit 113 stores setting information on a setting information storage unit 154.

FIG. 52 is a flowchart illustrating a method of controlling a video display device according to the embodiment.

The enhanced service management unit 130 confirms whether the ACR function is turned on in operation S1901.

If the ACR function is deactivated, the enhanced service management unit 130 does not perform a content information obtaining procedure any more.

If the ACR function is activated, the enhanced service management unit **130** extracts a certain section of a main AV content in operation **S1902**.

The enhanced service management unit **130** obtains content information of the main AV content on the basis of the extracted section in operation **S1903**.

The enhanced service management unit **130** synchronizes the reference time of the main AV content with the reference time of an alternative advertisement in operation **S1905**.

The enhanced service management unit **130** obtains an enhanced service on the basis of the obtained content information in operation **S1907**. The enhanced service management unit **130** obtains enhanced service information on the basis of the content information, and then obtains an enhanced service on the basis of the enhanced service information.

Then, the enhanced service management unit **130** confirms the ACR mode in operation **S1909**.

The enhanced service management unit **130** plays the enhanced service according to the ACR mode in operation **S1911**.

In more detail, if the ACR mode is an automatic play application mode, the enhanced service management unit **130** executes an automatic play application, and the executed automatic play application plays the obtained enhanced service.

If the ACR mode is the content provider application mode, the enhanced service management unit **130** executes a content provider application corresponding to the obtained content information in background. The enhanced service management unit **130** displays a content provider application when receiving a user input corresponding to an enhanced service use. This content provider application may play the obtained enhanced service. Instead that the content provider application is automatically executed in background, it may be executed by a user input.

If the ACR mode is the video display device manufacturer application mode, the enhanced service management unit **130** executes its video display device manufacturer application in background. The enhanced service management unit **130** displays the video display device manufacturer application when receiving a user input corresponding to an enhanced service use. This video display device manufacturer application may play the obtained enhanced service. Instead that the video display device manufacturer application is automatically executed in background, it may be executed by a user input.

Hereinafter, a method of controlling a video display device will be described with reference to FIGS. **53** and **54**.

FIG. **53** is a flowchart illustrating a method of controlling a video display device according to another embodiment.

When the video display device **100** is turned on, the enhanced service management unit **130** extracts a certain section of a main AV content in operation **S2001**.

The enhanced service management unit **130** obtains content information of the main AV content on the basis of the extracted section in operation **S2003**. For example, the enhanced service management unit **130** extracts watermark information from the extracted section, and obtains content information from the extracted watermark information. Additionally, the enhanced service management unit **130** extracts feature information of the extracted section, and transmits a query including the extracted feature information to the fingerprint server **22**, so that content information is obtained in response to the query.

The enhanced service management unit **130** obtains enhanced service information or enhanced service on the basis of the obtained content information in operation **S2005**.

After the enhanced service information or enhanced service is obtained, when a predetermined time (T_{delay}) elapses in operation **S2007**, the enhanced service management unit **130** performs a process from operation **S2001** again.

Even if a main AV content or channel is identified by ACR, since the video display device **100** may not predict when a main AV content is changed in the same channel, ACR does not need to be performed periodically. Additionally, when a user changes a channel, the video display device **100** needs to perform ACR with the maximum fast period in order to detect channel change timing.

For this, if a predetermined time (T_{delay}) is reduced, resources (CPU and memory occupation) of the video display device **100** are wasted, and a frequent request reduces usage efficiency of channel bandwidth.

Additionally, a frequent request increases the loads of the content recognizing service providing server **20**, the enhanced service information providing server **40**, and the enhanced service providing server **50**.

In relation to fingerprint based ACR, if a time from extracting a certain section of main AV content to obtaining content information is called T_{acr} , and a time from obtaining the content information to obtaining enhanced service information or enhanced service is called T_r , ACR period (T_p) may be determined as the following Equation 3.

$$T_p = T_{\text{acr}} + T_r + T_{\text{delay}} \quad [\text{Equation 3}]$$

Accordingly, when the same main AV content is maintained during T_c , the number of requests for enhanced service information or enhanced service may be determined as the following Equation 4.

$$N = \lceil T_c / T_p \rceil \quad [\text{Equation 4}]$$

In Equation 4, $\lceil \]$ represents a Gaussian symbol.

As shown in Equation 4, the $(N-1)$ number of requests for enhanced service information or enhanced service may not be necessary.

Moreover, when a channel is changed, a consumed time from channel change timing to obtaining content information is between T_{min} of Equation 5 and T_{max} of Equation 6.

$$T_{\text{min}} = T_{\text{acr}} + T_r \quad [\text{Equation 5}]$$

$$T_{\text{max}} = T_{\text{acr}} + T_r + T_{\text{delay}} + T_{\text{acr}} + T_r \quad [\text{Equation 6}]$$

An average consumed time T_t from channel change timing to obtaining content information is as the following Equation 7.

$$T_t = (T_{\text{min}} + T_{\text{max}}) / 2 \quad [\text{Equation 7}]$$

T_{min} corresponds to when an ACR operation starts immediately after channel change and T_{max} corresponds to when an ACR operation starts immediately before channel change.

If T_{delay} is reduced to shorten T_{max} , system load may be drastically increased.

FIG. **54** is a flowchart illustrating a method of controlling a video display device according to another embodiment.

When the video display device **100** is turned on, the enhanced service management unit **130** extracts a certain section of a main AV content in operation **S2101**.

The enhanced service management unit **130** obtains content information of the main AV content on the basis of the extracted section in operation **S2103**. For example, the enhanced service management unit **130** extracts watermark information from the extracted section, and obtains content information from the extracted watermark information. Addi-

tionally, the enhanced service management unit **130** extracts feature information of the extracted section, and transmits a query including the extracted feature information to the fingerprint server **22**, so that content information is obtained in response to the query.

The enhanced service management unit **130** obtains enhanced service information or enhanced service on the basis of the obtained content information in operation **S2105**. At this point, the enhanced service management unit **130** obtains ACR time information corresponding to content changing time information in addition to enhanced service information or enhanced service in operation **S2107**. Especially, the enhanced service information may include content changing time information.

Later, the enhanced service management unit **130** determines delay time (Tdelay) on the basis of the content changing time information in operation **S2109**. Especially, the enhanced service management unit **130** may delay an ACR operation until content change.

After the enhanced service information or enhanced service is obtained, even if the delay time (Tdelay) does not elapse in operation **S2111**, the enhanced service management unit **130** detects channel change in operation **S2113**. When receiving an uncompressed main AV content from the broadcast receiving device **60**, the video display device (**100**) may not easily detect channel change. Accordingly, the video display device **100** may detect channel change by detecting that there is no video or audio signal in the external input port **111** for a predetermined time. Especially, operation **S2113** for detecting channel change may be omitted.

When channel change is detected in operation **S2113**, the enhanced service management unit **130** may perform a process from operation **S2001** again.

After the enhanced service information or enhanced service is obtained, when a delay time (Tdelay) elapses in operation **S2111**, the enhanced service management unit **130** performs a process from operation **S2001** again.

Through the above process, the (N-1) number of requests for enhanced service information or enhanced service may not be necessary, so that system load may be reduced. Additionally, an average consumed time Tt from channel change timing to obtaining content information when content is changed in the same channel is Tmin.

Hereinafter, enhanced service obtaining timing will be described with reference to FIGS. **55** to **63**.

FIG. **55** is a timing diagram of an enhanced service according to an embodiment.

As shown in FIG. **55**, advertisement application, program related application, and CP related application are available at the timing ①. Singer information application, voting application, program related application, and CP related application are available at the timing ②. Advertisement application, voting application, program related application, and CP related application are available at the timing ③.

Like this, since available applications are different at various timings, they are required to be identified before application start timing.

FIG. **56** is a timing diagram of an enhanced service according to another embodiment.

In FIG. **56**, an enhanced service related to main AV content is a singer application.

A start time of the application is designated as Tstart(app). An end time of the application is designated as Tend(app). A last time that the application starts is designated as Ts-limit (app). T(app) represents the length of execution time of the singer application.

Additionally, metadata of the singer application corresponding to enhanced service information may range from Tstart(meta) to Tend(meta). t(m) is the length of available time of the metadata of the singer application.

t(pre) represents a time from Tend(meta) to Tstart(app).

t(w) represents a time from obtaining additional information to Tstart(app).

FIG. **57** is a ladder diagram illustrating a data flow in a fingerprint based network topology according to another embodiment.

When the video display device **100** extracts a certain section of a main AV content by sampling the main AV content in operation **S2201**.

The video display device **100** extracts feature information of the extracted a certain section in operation **S2203**.

The video display device **100** transmits a first query including the extracted feature information to the fingerprint server **22** in operation **S2205**.

The fingerprint server **22** searches an internal database to obtain content information and enhanced service information corresponding to the feature information of the first query, and generates a first reply including content information and enhanced service information in operation **S2207**. At this point, the first reply or enhanced service information includes a server standby time (ts(w)) expressed in Equation 8.

$$ts(w) = (\text{start time of enhanced service}) - (\text{start time of an section at which feature information is extracted}) \quad [\text{Equation 8}]$$

The fingerprint server **22** transmits the first reply to the video display device **100** in operation **S2209**.

The video display device **100** obtains a client standby time (tc(w)) on the basis of the server standby time (ts(w)) in the first reply or enhanced service information, and starts enhanced service obtained on the basis of the enhanced service information when the client standby time (tc(w)) elapses in operation **S2211**.

The client standby time (tc(w)) may be obtained by the following Equation 9.

$$tc(w) = ts(w) - t(a) \quad [\text{Equation 9}]$$

t(a) in Equation 9 is a time difference between sampling start time and first reply acquisition time. The video display device **100** may easily obtain a time difference between the sampling start time and the first reply acquisition time.

Theoretically, t(a) is expressed as the following Equation 10.

$$t(a) = t(s) + t(g) + t(q) + t(p) + t(r) \quad [\text{Equation 10}]$$

In Equation 10, t(s) represents a consumed time for sampling, t(g) represents a consumed time for extracting feature information from sampling data, t(q) represents a consumed time for transmitting a first query, t(p) represents a consumed time for the server **220** to search internal database, and t(r) represents a consumed time for transmitting a first reply.

FIG. **58** is a ladder diagram illustrating a data flow in a fingerprint based network topology according to another embodiment.

As shown in FIG. **58**, a main AV content starts at 9 p.m. and ends at 10 p.m. In relation to the main AV content, an application appl starts at 9:10 p.m. and ends at 9:20 p.m.

Let's assume that the video display device **100** samples and extracts feature information (kxxx) at 9:09:45 p.m. and transmits a first query including the extracted feature information (kxxx) to the fingerprint server **22**.

At this point, the fingerprint server **22** confirms that a time stamp of an section at which the extracted feature information is extracted is 9 min 45 sec. Additionally, the fingerprint

server **22** confirms that a start time of the application appl is 10 min 0 sec. Accordingly, the fingerprint server **22** may obtain a server standby time (ts(w)) of 15 sec (10 min 0 sec–9 min 45 sec).

The fingerprint server **22** provides a first reply including content information, enhanced service information, and server standby time (15 sec) to the video display device **100**.

If the video display device **100** receives the first reply at the timing of 9 hr 9 min 55 sec p.m., it may obtain t(a) of 10 sec (9 hr 9 min 55 sec–9 hr 9 min 45 sec).

Accordingly, the fingerprint server **100** may obtain a client standby time (tc(w)) of 5 sec (ts(w)–t(a)).

FIG. **59** is a ladder diagram illustrating a data flow in a fingerprint based network topology according to another embodiment.

When the video display device **100** extracts a certain section of a main AV content by sampling the main AV content in operation **S2301**.

The video display device **100** extracts feature information of the extracted section in operation **S2303**.

The video display device **100** transmits a first query including the extracted feature information to the fingerprint server **22** in operation **S2305**.

The fingerprint server **22** searches an internal database to obtain content information corresponding to the feature information of the first query, and generates a first reply including content information in operation **S2307**.

The fingerprint server **22** transmits the first reply to the video display device **100** in operation **S2309**.

The video display device **100** transmits a second query including the content information of the first reply to the enhanced service information providing server **40** in operation **S2311**.

The enhanced service information providing server **40** searches an internal database to obtain enhanced service information corresponding to the content information of the second query, and generates a second reply including the content information and enhanced service information in operation **S2313**. At this point, since the enhanced service information providing server **40** may obtain a start time of the section, at which the feature information is extracted, from the content information of the second query and a start time of the enhanced service from the internal database, it obtains the server standby time (ts(w)). Accordingly, the second replay or enhanced service information may include the server standby time (ts(w)) in Equation 8.

The enhanced service providing server **40** transmits the second reply to the video display device **100** in operation **S2315**.

The video display device **100** obtains the client standby time (tc(w)) in Equation 11 on the basis of the server standby time (ts(w)) in the second reply or enhanced service information, and starts enhanced service obtained on the basis of the enhanced service information when the client standby time (tc(w)) elapses in operation **S2317**.

The client standby time (tc(w)) is obtained by the following Equation 11.

$$tc(w)=ts(w)-t(a) \quad \text{[Equation 11]}$$

t(a) in Equation 11 is a time difference between sampling start time and second reply acquisition time. The video display device **100** may easily obtain a time difference between the sampling start time and the second reply acquisition time.

FIG. **60** is a flowchart illustrating a method of controlling a video display device according to another embodiment.

When the video display device **100** extracts watermark information from a certain section of a main AV content and

obtains content information and enhanced service information from the extracted watermark information in operation **S2401**. At this point, the enhanced service information includes a first standby time (ts(w)), which is conceptually similar to the server standby time in Equation 8.

The video display device **100** obtains a second standby time (tc(w)) on the basis of the first standby time (ts(w)), and starts enhanced service obtained on the basis of the enhanced service information when the second standby time (tc(w)) elapses in operation **S2403**. At this point, the second standby time (tc(w)) may be expressed as the following Equation 12.

$$tc(w)=ts(w)-t(a) \quad \text{[Equation 12]}$$

t(a) in Equation 12 is a time difference between a watermark information extraction start time and an enhanced service information acquisition time. The video display device **100** may easily obtain a time difference between the watermark information extraction start time and the enhanced service information acquisition time.

FIG. **61** is a ladder diagram illustrating a data flow in a watermark based network topology according to another embodiment.

The video display device **100** extracts watermark information from a certain section of a main AV content and obtains content information from the extracted watermark information in operation **S2501**.

The video display device **100** transmits a first query including the obtained content information to the enhanced service information providing server **40** in operation **S2503**.

The enhanced service information providing server **40** searches an internal database to obtain enhanced service information corresponding to the content information of the second query, and generates a first reply including the content information and enhanced service information in operation **S2505**. At this point, since the enhanced service information providing server **40** may obtain a start time of the section, at which the watermark information is extracted, from the content information of the first query and a start time of the enhanced service from the internal database, it obtains the server standby time (ts(w)). Accordingly, the first replay or enhanced service information may include the server standby time (ts(w)) in Equation 8.

The enhanced service providing server **40** transmits the first reply to the video display device **100** in operation **S2507**.

The video display device **100** obtains the client standby time (tc(w)) in Equation 11 on the basis of the server standby time (ts(w)) in the first reply or enhanced service information, and starts enhanced service obtained on the basis of the enhanced service information when the client standby time (tc(w)) elapses in operation **S2509**.

The client standby time (tc(w)) may be expressed as the following Equation 13.

$$tc(w)=ts(w)-t(a) \quad \text{[Equation 13]}$$

t(a) in Equation 13 is a time difference between a watermark information extraction start time and a first reply acquisition time. The video display device **100** may easily obtain a time difference between the watermark information extraction start time and the first reply acquisition time.

FIG. **62** is a timing diagram of an enhanced service according to another embodiment. Especially, FIG. **62** illustrates a timing diagram when t(a) is greater than t(pre) and t(m).

In relation to a query timing **1** of FIG. **62**, the video display device **100** may obtain enhanced service information through a query of t(m). However, since t(a) is greater than t(pre), the enhanced service may not start at its start time.

49

In relation to query timings **2** and **3** of FIG. **62**, when the video display device **100** transmits a query right before $t(m)$, since $t(a)$ is greater than $t(m)$, the video display device **100** may not obtain the enhanced service information. Therefore, the enhanced service may not be found.

FIG. **63** is a timing diagram of an enhanced service according to another embodiment. Especially, FIG. **62** illustrates a timing diagram when $t(a)$ is less than $t(pre)$ and $t(m)$.

In relation to query timings **1** and **2** of FIG. **63**, when the video display device **100** transmits a first query right before $t(m)$, since the video display device **100** may not obtain the enhanced service information, an enhanced service may not be found. However, since $t(a)$ is less than $t(m)$, the video display device **100** may obtain enhanced service information through the second query, and may find an enhanced service. At this point, the video display device **100** starts the enhanced service after $tc(w)$ of standby.

In relation to the query timing **3** of FIG. **63**, even when the video display device **100** transmits a query right before end time of $t(m)$, since $t(a)$ is less than $t(pre)$, the video display device **100** may start the enhanced service at the accurate start time of the enhanced service. At this point, the video display device **100** starts the enhanced service after $tc(w)$ of standby.

Hereinafter, a method of managing a life cycle will be described with reference to FIGS. **64** to **67** according to an embodiment.

FIG. **64** is a hierarchy diagram of an enhanced service management unit according to another embodiment.

As shown in FIG. **64**, the enhanced service management unit **130** includes an ACR engine **131e**, a browser **132e**, an ACR plug in **133e**, a life cycle management application (LCM app) **134e**, and at least one application **135e**.

The ACR plug in **133e** is plugged in the browser **132e**.

The life cycle management application **134e** manages download, execution, and termination of the application **135e**.

FIG. **65** is a ladder diagram illustrating a data flow in a fingerprint based network topology according to another embodiment.

The life cycle management application **134e** of FIG. **65** may use methods and events shown in Table 14.

TABLE 14

method	ACRMetadata getACRMetadata()	
Event	function onContentChanged(String contentId)	When this event is registered, this is called whenever content is changed. If it's not registered, nothing will be called.
	function onMediaTimeUpdated(Number mediaTime)	When this event is registered, this is called whenever media time is updated. Since media time is always changed, it will provide ACR app with up-to-date media time synchronized with AV stream.

50

ACRMetadata class is shown in Table 15.

TABLE 15

	Name	description
property	readonly String contentId	
	readonly Number mediaTime (relative time to the content, unit = sec)	mediaTime is adjusted in order to reflect network roundtrip delay. The formula is as follows. mediaTime = media time of from ACR query response + network delay

The ACR engine **131e** extracts feature information of a certain section of a main AV content in operation **S2601**.

The ACR engine **131e** transmits a content information request message including the extracted feature information to the content recognizing service providing server **20** in operation **S2603**.

The content recognizing service providing server **20** searches an internal database to obtain content information corresponding to the feature information, and transmits the obtained content information to the ACR engine **131e** in operation **S2605**.

The ACR engine **131e** delivers the received content information to the ACR plug in **133e** in operation **S2607**, and the ACR plug in **133e** delivers the received content information to the life cycle management application **134e** in operation **S2609**. Especially, the life cycle management application **134e** may obtain content information through a getACRMetadata() method, an onContentChanged(String contentId) event, or an onMediaTimeUpdated(Number mediaTime) event.

The life cycle management application **134e** transmits an enhanced service information request message including content information to the enhanced service providing server **50** or the enhanced service information providing server **40** in operation **S2611**.

The enhanced service providing server **50** or enhanced service information providing server **40** search an internal database to obtain enhanced service information corresponding to the content information, and transmits the obtained enhanced service information to the life cycle management application **134e** in operation **S2613**.

The life cycle management application **134e** manages the application **135e** according to the received enhanced service information in operation **S2615**. As described above, the enhanced service information may include an enhanced service address, an enhanced service start time, and an enhanced service end time. The life cycle management application **134e** accesses the enhanced service address to obtain the application **135e** corresponding to the enhanced service, starts the obtained application **135e** at the enhanced service start time, and ends the application **135e** at the enhanced service end time.

FIG. **66** is a ladder diagram illustrating a data flow in a fingerprint based network topology according to another embodiment.

TABLE 16

	Name	description
property	readonly ACRMetadata metadata	
method	ACRMetadata getACRMetadata()	

51

TABLE 16-continued

	Name	description
Event	function onContentChanged(String contentId)	When this event is registered, this is called whenever content is changed. If it's not registered, nothing will be called.
	function onMediaTimeUpdated(Number mediaTime)	When this event is registered, this is called whenever media time is updated. Since media time is always changed, it will provide ACR app with up- to-date media time synchronized with AV stream.

TABLE 17

	Name	description
property	readonly String contentId readonly Number mediaTime (relative time to the content, unit = sec) readonly String appURL readonly Number appLaunchTime readonly Number appExitTime	

First, the enhanced service providing server **50** or enhanced service information providing server **40** provides enhanced service information to the content recognizing service providing server **20** in operation **S2701**.

The ACR engine **131e** extracts feature information of a certain section of a main AV content in operation **S2703**.

The ACR engine **131e** transmits an ACR query message including the extracted feature information to the content recognizing service providing server **20** in operation **S2705**.

The content recognizing service providing server **20** searches an internal database to obtain content information and enhanced service information corresponding to the feature information, and transmits the obtained content information and enhanced service information to the ACR engine **131e** in operation **S2707**.

The ACR engine **131e** delivers the received content information and enhanced service information to the ACR plug in **133e** in operation **S2709**, and the ACR plug in **133e** delivers the received content information and enhanced service information to the life cycle management application **134e** in operation **S2711**.

Especially, the life cycle management application **134e** may obtain content information and addition service information through an ACRMetadata getACRMetadata() method, an onContentChanged(String contentId) event, or an onMediaTimeUpdated(Number mediaTime) event.

The life cycle management application **134e** manages the application **135e** according to the received enhanced service information in operation **S2713**. As described above, the enhanced service information may include an enhanced service address, an enhanced service start time, and an enhanced service end time. The life cycle management application **134e** accesses the enhanced service address to obtain the application **135e** corresponding to the enhanced service, starts the obtained application **135e** at the enhanced service start time, and ends the application **135e** at the enhanced service end time.

52

FIG. **67** is a screen controlled by a life cycle management application according to an embodiment.

As shown in FIG. **67**, when the application **135e** reaches a start time, the life cycle management application **134e** displays a trigger icon **610**, which notifies that the application **135e** is available, on the screen **600**.

When a specific button such as a red button of a remote controller is selected, the life cycle management application **134e** displays information on the application **135e** on the additional information display area **620**.

Next, a structure of a video display device according to an embodiment with reference to FIGS. **68** and **69**.

FIG. **68** is a block diagram illustrating a structure of a fingerprint based video display device according to another embodiment.

As shown in FIG. **68**, a tuner **501** extracts a symbol from an 8-VSB RF signal transmitted through an air channel.

An 8-VSB demodulator **503** demodulates the 8-VSB symbol that the tuner **501** extracts and restores meaningful digital data.

A VSB decoder **505** decodes the digital data that the 8-VSB demodulator **503** to restore an ATSC main service and ATSC M/H service.

An MPEG-2 TP Demux **507** filters a Transport Packet that the video display device **100** is to process from an MPEG-2 Transport Packet transmitted through an 8-VSB signal or an MPEG-2 Transport Packet stored in a PVR Storage to relay the filtered Transport Packet into a processing module.

A PES decoder **539** buffers and restores a Packetized Elementary Stream transmitted through an MPEG-2 Transport Stream.

A PSI/PSIP decoder **541** buffers and analyzes PSI/PSIP Section Data transmitted through an MPEG-2 Transport Stream. The analyzed PSI/PSIP data are collected by a Service Manager (not shown), and then, is stored in DB in a form of Service Map and Guide data.

A DSMCC Section Buffer/Handler **511** buffers and processes DSMCC Section Data for file transmission through MPEG-2 TP and IP Datagram encapsulation.

An IP/UDP Datagram Buffer/Header Parser **513** buffers and restores IP Datagram, which is encapsulated through DSMCC Addressable section and transmitted through MPEG-2 TP to analyze the Header of each Datagram. Additionally, an IP/UDP Datagram Buffer/Header Parser **513** buffers and restores UDP Datagram transmitted through IP Datagram, and then analyzes and processes the restored UDP Header.

A Stream component handler **557** may include ES Buffer/Handler, PCR Handler, STC module, Descrambler, CA Stream Buffer/Handler, and Service Signaling Section Buffer/Handler.

The ES Buffer/Handler buffers and restores an Elementary Stream such as Video and Audio data transmitted in a PES form to deliver it to a proper A/V Decoder.

The PCR Handler processes Program Clock Reference (PCR) Data used for Time synchronization of Audio and Video Stream.

The STC module corrects Clock values of the A/V decoders by using a Reference Clock value received through PCR Handler to perform Time Synchronization.

When scrambling is applied to the received IP Datagram, the Descrambler restores data of Payload by using Encryption key delivered from the CA Stream Handler.

The CA Stream Buffer/Handler buffers and processes Data such as Key values for Descrambling of EMM and ECM, which are transmitted for a Conditional Access function through MPEG-2 TS or IP Stream. An output of the CA

Stream Buffer/Handler is delivered to the Descrambler, and then, the descrambler descrambles MPEG-2 TP or IP Datagram, which carries A/V Data and File Data.

The Service Signaling Section Buffer/Handler buffers, restores, and analyzes NRT Service Signaling Channel Section Data transmitted in a form of IP Datagram. The Service Manager (not shown) collects the analyzed NRT Service Signaling Channel Section data and stores them in DB in a form of Service Map and Guide data.

The A/V Decoder **561** decodes the Audio/Video data received through an ES Handler to present them to a user.

An MPEG-2 Service Demux (not shown) may include an MPEG-2 TP Buffer/Parser, a Descrambler, and a PVR Storage module.

An MPEG-2 TP Buffer/Parser (not shown) buffers and restores an MPEG-2 Transport Packet transmitted through an 8-VSB signal, and also detects and processes a Transport Packet Header.

The Descrambler restores the data of Payload by using an Encryption key, which is delivered from the CA Stream Handler, on the Scramble applied Packet payload in the MPEG-2 TP.

The PVR Storage module stores an MPEG-2 TP received through an 8-VSB signal at the user's request and outputs an MPEG-2 TP at the user's request. The PVR storage module may be controlled by the PVR manager (not shown).

The File Handler **551** may include an ALC/LCT Buffer/Parser, an FDT Handler, an XML Parser, a File Reconstruction Buffer, a Decompressor, a File Decoder, and a File Storage.

The ALC/LCT Buffer/Parser buffers and restores ALC/LCT data transmitted through a UDP/IP Stream, and analyzes a Header and Header extension of ALC/LCT. The ALC/LCT Buffer/Parser may be controlled by an NRT Service Manager (not shown).

The FDT Handler analyzes and processes a File Description Table of FLUTE protocol transmitted through an ALC/LCT session. The FDT Handler may be controlled by an NRT Service Manager (not shown).

The XML Parser analyzes an XML Document transmitted through an ALC/LCT session, and then, delivers the analyzed data to a proper module such as an FDT Handler and an SG Handler.

The File Reconstruction Buffer restores a file transmitted through an ALC/LCT, FLUTE session.

If a file transmitted through an ALC/LCT and FLUTE session is compressed, the Decompressor performs a process to decompress the file.

The File Decoder decodes a file restored in the File Reconstruction Buffer, a file decompressed in the decompressor, or a film extracted from the File Storage.

The File Storage stores or extracts a restored file if necessary.

The M/W Engine (not shown) processes data such as a file, which is not an A/V Stream transmitted through DSMCC Section and IP Datagram. The M/W Engine delivers the processed data to a Presentation Manager module.

The SG Handler (not shown) collects and analyzes Service Guide data transmitted in an XML Document form, and then, delivers them to the EPG Manager.

The Service Manager (not shown) collects and analyzes PSI/PSIP Data transmitted through an MPEG-2 Transport Stream and Service Signaling Section Data transmitted through an IP Stream, so as to produce a Service Map. The Service Manager (not shown) stores the produced service map in a Service Map & Guide Database, and controls an access to a Service that a user wants. The Service Manager is

controlled by the Operation Controller (not shown), and controls the Tuner **501**, the MPEG-2 TP Demux **507**, and the IP Datagram Buffer/Handler **513**.

The NRT Service Manager (not shown) performs an overall management on the NRT service transmitted in an object/file form through a FLUTE session. The NRT Service Manager (not shown) may control the FDT Handler and File Storage.

The Application Manager (not shown) performs overall management on Application data transmitted in a form of object and file.

The UI Manager (not shown) delivers a user input to an Operation Controller through a User Interface, and starts a process for a service that a user requests.

The Operation Controller (not shown) processes a command of a user, which is received through a UI Manager, and allows a Manager of a necessary module to perform a corresponding action.

The Fingerprint Extractor **565** extracts fingerprint feature information from an AV stream.

The Fingerprint Comparator **567** compares the feature information extracted by the Fingerprint Extractor with a Reference fingerprint to find an identical content. The Fingerprint Comparator **567** may use a Reference fingerprint DB stored in local and may query a Fingerprint query server on the internet to receive a result. The matched result data obtained by a comparison result may be delivered to Application and used.

As an ACR function managing module or an application module providing an enhanced service on the basis of ACR, the Application **569** identifies a broadcast content in watching to provide an enhanced service related to it.

FIG. **69** is a block diagram illustrating a structure of a watermark based video display device according to another embodiment.

Although the watermark based video display device of FIG. **69** is similar to the fingerprint based video display device of FIG. **68**, the fingerprint based video display device does not include the Fingerprint Extractor **565** and the Fingerprint Comparator **567**, but further includes the Watermark Extractor **566**.

The Watermark Extractor **566** extracts data inserted in a watermark form from an Audio/Video stream. The extracted data may be delivered to an Application and may be used.

According to embodiments, services led by a broadcasting station are available. Especially, the embodiments provide alternative advertising services, scene associated information providing services, rating-based content services, and user attribute-based services.

In addition, loads of the server and video display device are reduced.

Additionally, according to embodiments, even when receiving AV contents having no time information or AV contents having a different reference time than enhanced service, a video display device may synchronize the time-sensitive enhanced service with the AV contents.

Moreover, according to embodiments, information search, chatting, news search, digital media download, product catalog download, and product purchase, which are related to main AV contents, are available without inconvenient text input using a remote controller.

Moreover, the above methods of the present invention can also be embodied as computer readable codes on a computer readable recording medium. Examples of the computer readable recording medium include read-only memory (ROM), random-access memory (RAM), CD-ROMs, magnetic tapes,

floppy disks, optical data storage devices, and carrier waves (such as data transmission through the Internet).

The configurations and methods of the above-described embodiments are applied to the video display device without any restriction, and all or some of the embodiments may be selectively combined to have various modifications.

Although embodiments have been described with reference to a number of illustrative embodiments thereof, it should be understood that numerous other modifications and embodiments can be devised by those skilled in the art that will fall within the spirit and scope of the principles of this disclosure. More particularly, various variations and modifications are possible in the component parts and/or arrangements of the subject combination arrangement within the scope of the disclosure, the drawings and the appended claims. In addition to variations and modifications in the component parts and/or arrangements, alternative uses will also be apparent to those skilled in the art.

What is claimed is:

1. A method of controlling a video display device, the method comprising:
 - displaying an automatic content recognition (ACR) function setting user interface (UI) through a display unit;
 - receiving ACR function setting information according to an input of a user based on the ACR function setting UI;
 - storing the ACR function setting information on a storage unit;
 - receiving a broadcasting signal through a tuner;
 - obtaining an uncompressed audio-visual (AV) content through a receiving unit;
 - displaying the uncompressed AV content through the display unit;
 - extracting characteristic information from a content section of the uncompressed AV content;
 - transmitting a first query including the characteristic information to a first server;
 - obtaining an address of a second server based on the first query;
 - transmitting a second query to the second server;
 - obtaining a start time of an enhanced service based on the second query; and
 - displaying the enhanced service based on the start time through the display unit.
2. The method according to claim 1, wherein the display unit includes a first area and a second area, and the first area displays the uncompressed AV content and the second area displays the enhanced service.
3. The method according to claim 2,
- wherein the second area can be overlaid on the first area.
4. The method according to claim 2, further comprising:
 - obtaining information on the uncompressed AV content, based on the second query;
 - storing a plurality of applications that is provided by a manufacturer and a content provider in the storage unit; and
 - displaying a user interface of a menu that represents the plurality of applications through a third area on the display unit.
5. The method according to claim 4, wherein the first area, second area and third area can be resized.
6. The method according to claim 4, further comprising:
 - receiving a first input for selecting a searching menu;
 - obtaining a searching list related to the uncompressed AV content, based on the information for the uncompressed AV content;
 - displaying the searching list through the second area;

receiving a second input for selecting an item to be searched in the searching list; and
displaying the selected item according to the received second input through the second area.

7. The method according to claim 4, further comprising: receiving a input for selecting a SNS (social network service) menu;

obtaining a chatting list including viewers of the uncompressed AV content, based on the information on the uncompressed AV content; and

displaying the chatting list through the second area.

8. The method according to claim 4, further comprising:

receiving a third input for selecting a viewer menu;

obtaining first information on viewers watching the uncompressed AV content, based on the information on the uncompressed AV content;

obtaining second information on one or more friend related to a user of the video display device, based on the SNS application; and

displaying a list of the friends that watches the uncompressed AV content, based on the first information and second information.

9. The method according to claim 8, further comprising:

receiving a fourth input for selecting a friend in the list of the friends; and

displaying a chatting window through the second area, when the selected friend is watching the uncompressed AV content.

10. The method according to claim 9, further comprising: transmitting a message for recommending to watch the uncompressed AV content, when the selected friend is not watching the uncompressed AV content.

11. The method according to claim 4, further comprising:

receiving a fifth input for selecting menu of preference;

displaying the preference corresponding to the uncompressed AV content, based on the information regarding the uncompressed audio or video content;

receiving a sixth input for the preference about the uncompressed AV content; and

posting the preference about the uncompressed AV content, through the SNS application, based on the sixth input.

12. The method according to claim 4, further comprising: receiving a seventh input for selecting a menu of a media related to the uncompressed AV content;

obtaining the media related to the uncompressed AV content; and

displaying the obtained media through the second area.

13. The method according to claim 4, further comprising:

receiving an eighth input for selecting a menu of a catalog including goods related to the uncompressed AV content;

displaying the catalog including the goods through the second area; and

displaying a page for buying the goods selected by the user of the video display device.

14. A video display device comprising:

a display unit;

a control unit to generate an automatic recognition (ACR) function setting user interface (UI) through the display unit and to receive ACR function setting information according to an input of a user based on the ACR function UI;

a storage unit to store the ACR function setting information;

a tuner to receive a broadcasting signal;

an receiving unit to obtain an uncompressed AV content;

57

the control unit to extract characteristic information from a content section of the uncompressed AV content, and to transmit a first query including the characteristic information to a first server, and to obtain an address of a second server based on the first query, to transmit a second query to the second server, and to obtain a start time of an enhanced service based on the second query; and

the display unit to display the uncompressed AV content and the enhanced service based on the start time.

15. The device according to claim **14**, wherein the display unit includes a first area and a second area, and the first area displays the uncompressed AV content and the second area displays the enhanced service.

16. The device according to claim **14**, wherein the control unit obtains information on the uncompressed AV content, based on the second query, and stores a plurality of applications that is provided by a manufacturer and a content provider, and

the display unit displays a user interface of a menu that represents the plurality of applications through a third area.

17. The device according to claim **16**, wherein the first area, second area and third area can be resized.

18. The device according to claim **16**, wherein the control unit receives a first input for selecting a searching menu, and

58

obtains a searching list related to the uncompressed AV content, based on the information on the uncompressed AV content, and receives a second input for selecting an item to be searched in the searching list; and

the display unit displays the searching list through the second area, and displays information according to the received second input through the second area.

19. The device according to claim **16**, wherein the control unit receives a input for selecting a SNS (social network service) menu, and obtains a chatting list including viewers of the uncompressed AV content, based on the information on the uncompressed AV content, and

the display unit displays the chatting list through the second area.

20. The device according to claim **19**, wherein the control unit receives a third input for selecting a viewer menu, obtains first information on viewers watching the uncompressed AV content, based on the information on the uncompressed AV content and obtains second information on one or more friend related to a user of the video display device, based on a SNS application, and

the display unit displays a list of the friends that watches the uncompressed AV content, based on the first information and second information.
